# Preface

HAWE Hydraulik SE was established as „Heilmeyer & Weinlein, Fabrik für Oelhydraulik GmbH & Co. KG in Munich in 1949. Innovative ideas, high product quality and a lot of enthusiasm has contributed to HAWE's steady growth. We now have more than 2200 employees, a worldwide sales network with sales offices in Germany, 14 HAWE subsidiaries and more than 30 representatives international.

The product range has been widened continuously over the years, covering standard valves e.g. pressure valves etc. as well as many products tailored for special purposes such as pre-fill valves, lifting/lowering valves etc.

There are three distinguishing features that make HAWE products unique in the fluid power industry:

All HAWE products are developed based on the HAWE modular design concept. Secondly, all pressurized parts are made of steel. And finally, sustainable business takes top priority during manufacture and installation, meaning certification according to ISO 9001 (quality management), ISO 14001 (environmental management) and EN 16001 (energy management) is a given.

This Product Overview is intended to give you a summary of the general capabilities of the variety of pumps, valves, and other equipment manufactured by HAWE. This publication is supplemented with additional product specific pamphlets (listed at "Additional Information"), which contain detailed technical specifications as well as further information. The technical information contained in these pamphlets is substantial and include guarantee and warranty relevant details. These pamphlets may be ordered from your local HAWE sales representative (see addresses on page 278) or directly from HAWE in Munich (contact: [info@hawe.de](mailto:info@hawe.de)).

It goes without saying that your sales partner (please see "Office addresses" attached for the addresses) and our "Technical Support" team in Munich would be glad to help with the selection, configuration and specification of the optimal HAWE products for you.

**Note:**

All information from HAWE, our staff or our representatives provide product or system options for further investigation by users having technical expertise. Before you select or use any product or system it is important that you analyse all aspects (incl. safety regulations) of your application and review the information concerning the product or system in the current product catalogue.

All dimensions in mm, subject to change without notice!

# Our vertical range of manufacture ensures superior quality!

## Efficiency:

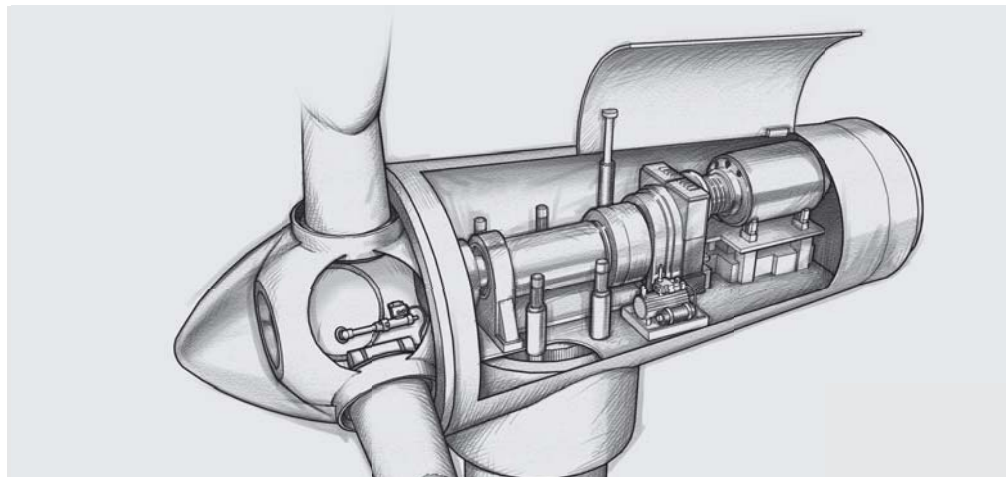

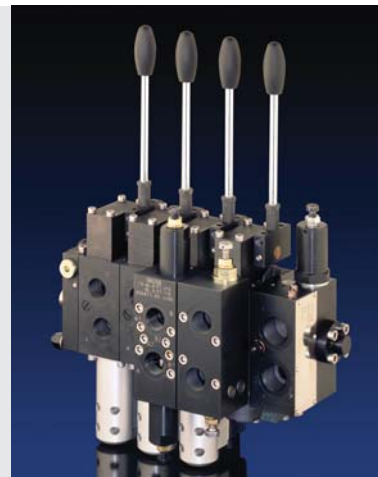

### Example: Machine tools

- Compact hydraulic power packs with small tank capacity
- Zero leakage directional seated valves instead of directional spool valves
- Accumulator charged operation with idle pump circulation

### Example: Truck mounted cranes

- Variable displacement axial piston pumps with clever controller technique
- Well-engineered Load-Sensing systems
- Quick response and directional spool valves with minimized leakage

HAWE Proportional directional spool valve:  
Sensible and powerfull fine adjustability for all mobile application with a maximum of robustness. Also in harsh environments and up to 420 b

## Flexibility:

### Example: Tractors for logging and agriculture

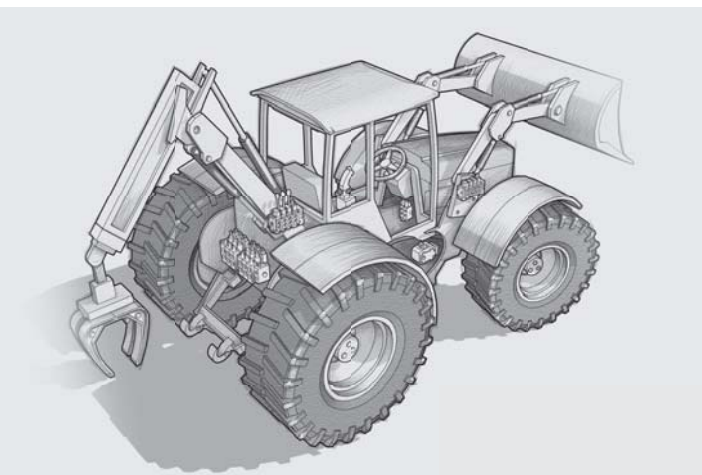

- Accurate controls that can be easily customized and extended
- One product covering all functions (boom, supports, steering etc.)
- Various sizes can be combined, additional function can be integrated

### Example: Food processing

- Versatile, compact hydraulic power packs
- AC or DC-drive for low and high pressure applications
- All required functions can be implemented via directly mounted modular valve banks

We offer a wide range of various directional seated valves to ensure a safe and powerful functionality of your machine.

## Reliability:

### Example: Wind energy plants

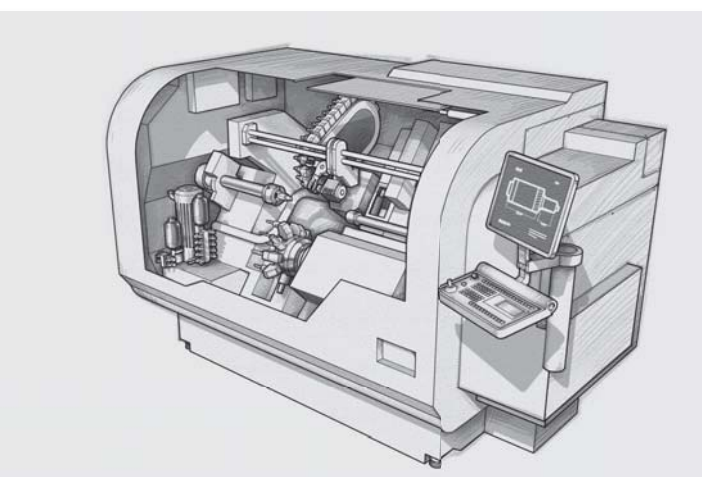

- Sturdy long-lived components ensure long service life
- Modular design eases maintenance
- Hydraulic controls also for severe ambient conditions (hot, cold, moist, etc.)

We provide with our compact hydraulic power packs energy efficient solutions for brake controls.

### Example: Construction machines

- Well proven systems consisting of pump, hydraulic controls, over-center valve and electronics
- Modular electronic controls perfectly fitting the hydraulics
- Various approved solutions for oscillation dampening

## Technology:

### Example: Tools with hydraulic drive

- High power density via compact design
- Wide range of modular high pressure components (max. 700 bar)
- Two-stage pumps efficiently generate the necessary working pressure

### Example: Hydraulic presses

- Hydraulic power controlled reliable and smooth
- Decentralized hydraulic controls via compact hydraulic power packs
- Various solutions for synchronous operation

# SOLUTIONS FOR A WORLD UNDER PRESSURE

# Efficiency in modules

Hydraulics is based on a simple principle that allows its use in a wide variety of different applications. In order to use all of these variations, we offer a modular range of products. As a direct result of our development philosophy, the individual HAWE components supplement one another to form one complete product range. They can then be combined to form solutions and systems. Unified components and the possibility to combine them individually serve to increase efficiency at an ideal price-performance ratio.

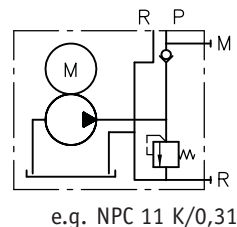

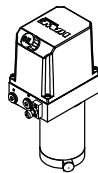

- individual components supplement one another to form one complete product range
- allows customer-specific solutions

## Compact hydraulic power packs

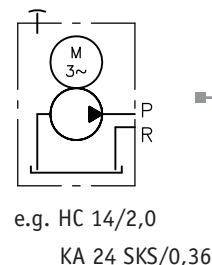

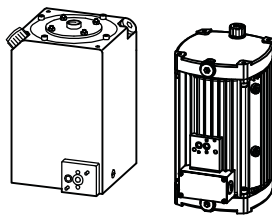

### Type NPC

for miniature hydraulic systems  
with 5...10% ED ( $P_{\max} = 700$  bar,  
 $Q_{\max} = 2.1$  lpm)

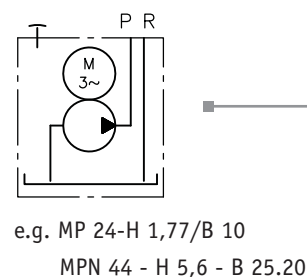

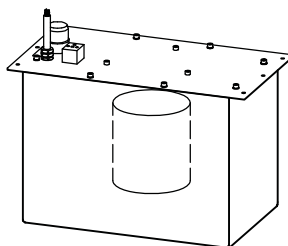

### Type HC, HCW, KA, KAW

for miniature hydraulic systems  
with 10...30% ED ( $P_{\max} = 700$  bar,  
 $Q_{\max} = 20.1$  lpm), available in 4 sizes,  
also as dual circuit pump

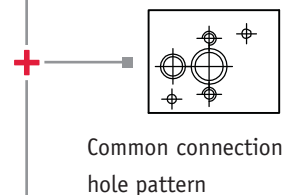

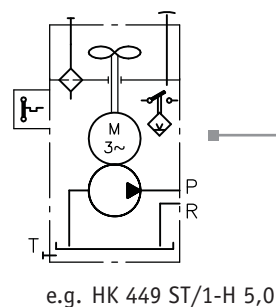

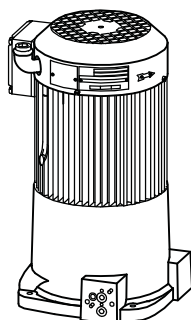

### Type MP, MPN, MPW, MPNW

suitable for intermittent or load/no  
load operation ( $P_{\max} = 700$  bar,  
 $Q_{\max} = 15$  lpm) available in 5 sizes,  
also as dual stage pump, various  
tank sizes

### Type HK, HKF, HKL

suitable for continuous operation  
( $P_{\max} = 700$  bar,  $Q_{\max} = 16$  lpm),  
available in 3 sizes, also as double  
and triple circuit pump

### Order examples

## Compact hydraulic power packs

## 1.1 Miniature hydraulic power packs type NPC

The NPC compact hydraulic power pack can be universally used in short period operation for all consumers with low oil requirements. The energy is supplied by direct current. A pressure-limiting valve is integrated into the intermediate flange. The NPC can be used on construction sites and in other mobile applications. It can be developed into a compact, complete hydraulic control by connecting valves from the VB or BWN(H) ranges.

### Features and benefits:

- Very low space requirements and easy to transport
- Supplied with direct current at 12V DC or 24V DC
- Particularly suited to mobile applications
- Long service life and excellent reliability achieved by using radial piston pumps
- Environmentally sound thanks to low oil fill volumes and minimum amount of oil to be disposed of
- Low costs for hydraulic fluid
- Co-ordinated range of valves and accessories from the modular system

**Intended applications:**

- Rivets
- Ventilation of winch brakes
- Hydraulic jigs
- Crimping

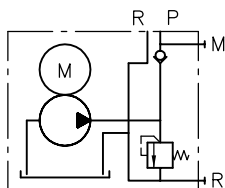

<b>Nomenclature:</b>	Radial piston pump with integrated electric motor (version for 3-phase mains)

# Compact hydraulic power packs

1.1

Compact hydraulic power packs type HC and HCW

The ready-for-connection compact hydraulic power pack can be used in applications where consumers with a low oil volume requirement have to be connected in intermittent operation (S 3), e.g. in machine tool and jig construction, or in general machine engineering. The power pack consists of the housing (tank) with integrated motor and pump. The filling gauge on HC(W) size 2, 3 and 4 types enables the fluid level to be controlled even during operation. The electrical connections are made via an integrated terminal box. Compact control systems can be created by mounting various combinations of connection blocks and valve banks. Float switches and temperature switches are optionally available for perfect monitoring.

Features and benefits:

- Wide range of application achieved with four sizes
- Direct current version for voltage supply with 12 V DC or 24 V DC
- Long service life and excellent reliability achieved by using radial piston pumps
- Low oil fill volumes make it environmentally sound thanks to the small amount of oil to be disposed of and the low costs for hydraulic fluid
- Co-ordinated range of valves and accessories from modular system
- Suitable for vertical and horizontal installation

Intended applications:

- Brake and rotor adjustment modules on wind turbines
- Tracking systems on solar panels and parabolic aerials
- Clamping systems on machine tools and jigs
- Rivets and clinching equipment
- Welding robots
- Lubrication systems

Nomenclature:	Radial piston pump with integrated electric motor (3-phase or 1-phase version)
Design:	Oil immersed hydraulic power pack for intermittent service (S3-service)
p <sub>max</sub> :	Radial piston pump 700 bar Gear pump 180 bar
Q <sub>max</sub> :	Radial piston pump approx. 4.4 lpm (V <sub>g</sub> = 1.6 cm <sup>3</sup> /rev) Gear pump approx. 3.4 lpm (V <sub>g</sub> = 1.3 cm <sup>3</sup> /rev)
V <sub>usable max</sub> :	8 l

# Compact hydraulic power packs

1.1

Compact hydraulic power packs type KA and KAW

The ready-for-connection compact hydraulic power pack consists of a housing (tank) with integrated motor and pump. The tank volume (effective volume) can be increased by extensions. A vertical and a horizontal variant are available. A filling gauge enables visual control of the fluid level even during operation. The electrical connections are made via an integrated terminal box. Compact control systems can be created by mounting various combinations of connection blocks and valve banks. Float switches and temperature switches are optionally available for perfect monitoring.

**Features and benefits:**

- Additional external fan for optimum load set
- Fill/effective volumes can be flexibly extended by modular tank extensions
- Long service life and high reliability achieved by using radial piston pumps
- Low oil fill volume makes it environmentally sound thanks to the small amount of oil to be disposed of and the low costs for hydraulic fluid
- Co-ordinated range of valves and accessories from modular system
- Suitable for vertical and horizontal installation
- Optimum efficiency achieved by suboil motor cooling, direct transmission of force and cleverly designed heat dissipation

**Intended applications:**

- Brake and rotor adjustment modules on wind turbines
- Clamping systems on machine tools and appliances
- Torque wrenches
- Rivets and clinching equipment
- Presses
- Handling systems

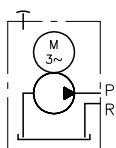

Nomen-clature:	Radial piston or gear pump with integrated motor single or dual circuit pump
Design:	Oil immersed hydraulic power pack for intermittent or load/no load operation (S3-service)
p <sub>max</sub> :	Radial piston pump 700 bar Gear pump 180 bar
Q <sub>max</sub> :	Radial piston pump approx. 7 lpm (V <sub>g</sub> = 2.29 cm <sup>3</sup> /rev) Gear pump approx. 24.1 lpm (V <sub>g</sub> = 7.9 cm <sup>3</sup> /rev)
V <sub>tank max</sub> :	2 ... 10 l

# Compact hydraulic power packs

1.1

Hydraulic power packs type MP and MPN

These compact hydraulic power packs are designed for use in stationary applications, which work in intermittent or load/no load operation. Two different pumps can be easily mounted as an option to make this type particularly suitable for dual-stage drives such as in presses or dual-circuit systems. The tank size and drive power can be easily adjusted to the system requirements using several sizes. Compact control systems can be created by directly mounting connection blocks and valve banks.

**Features and benefits:**

- Intermittent or load/no load operation S3 or S6
- Long service life and excellent reliability achieved by using radial piston pumps
- Low oil fill volumes make it environmentally sound thanks to small amount of oil to be disposed of and low costs for hydraulic fluid
- Two-stage valves and switch units for press controls can be directly mounted
- Co-ordinated range of valves and accessories from modular system
- Dual-circuit pumps available

**Intended applications:**

- Brake and rotor adjustment modules on wind turbines
- Counterbalance and provision of clamping pressure for lathe chucks, tailstocks and steady rests on large machine tools and turning centres
- Presses and other shaping machines
- Handling and clamping systems on machine tools and jigs
- Lubrication systems

<b>Nomenclature:</b>	Radial piston and/or gear pump with integrated motor single or dual circuit pump
<b>Design:</b>	Oil immersed hydraulic power pack for intermittent or load/no load operation (S2-/S3-/S6-service)
<b>p<sub>max</sub>:</b>	Radial piston pump 700 bar (high pressure) Gear pump 220 bar (low pressure)
<b>Q<sub>max</sub>:</b>	13.1 lpm (high pressure) (V <sub>g</sub> = 10.7 cm <sup>3</sup> /rev) 135 lpm (low pressure) (V <sub>g</sub> = 60 cm <sup>3</sup> /rev)
<b>V<sub>t max</sub>:</b>	approx. 100 lpm

# Compact hydraulic power packs

1.1

Compact hydraulic power packs type HK, HKF, HKL

Because of the unique integrated fan configuration, the “ready for connection” hydraulic power packs are ideal for continuous operation. Another version for temperature sensitive applications features an auxiliary blower, thereby gaining improved cooling (approx. 25%). This type is available for single circuit operation (radial piston or gear pump), dual circuit operation (radial piston and/or gear pump) or triple circuit operation (radial piston pump only). Both single and dual circuit pumps are also available as a horizontal version (type HKL). Complete hydraulic control systems can be created by directly mounting various combinations of connection blocks and valve banks to the hydraulic power pack. These hydraulic power packs are used for machine tools (lathes and milling machines), jigs or general machine applications, making a commonly used external radiator superfluous.

**Features and benefits:**

- Suited for permanent and intermittent operation (S1/S6 service)
- Additional separately driven fan for maximum utilisation of power
- 3 sizes enable wide field of application
- Radial piston pumps ensure long service life and high reliability
- Small filling volume minimize costs for fluid and fluid disposal
- Matching valve and accessories from a modular system
- Available as single to triple circuit pump

**Intended applications:**

- Supply of clamping pressure for lathe chucks, tail stocks, steady rests at machine tools and machining centers
- Welding machines, roboter
- Endurance test benches
- Endurance test bench construction
- Torque wrench

Nomenclature:	Radial piston pump and/or gear pump with integrated motor (version for 3-phase mains)
Design:	Oil immersed compact hydraulic power pack for permanent and intermittent operation (S1/S6 service)
pmax:	700 bar (radial piston pump) 180 bar (gear pump)
Qmax:	Radial piston pump (high pressure) approx. 13 lpm ( $V_g = 9.15 \text{ cm}^3/\text{rev}$ ) Gear pump (low pressure) 24 lpm ( $V_g = 17.0 \text{ cm}^3/\text{rev}$ )
Vusable max:	approx. 11.1 l

# Compact hydraulic power packs

1.1

Connection blocks type A, B, and C

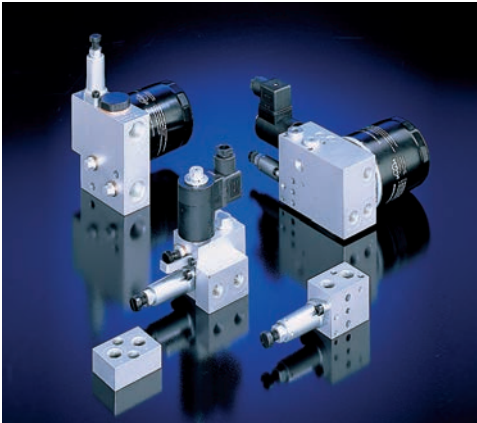

Connection blocks are used to develop types HC, KA, MP, MPN, HK, HKF and HKL compact hydraulic power packs into a ready-for-connection solution. Compact control systems can be created by directly mounting valve banks to the connection blocks on type A (see “complete solutions in modular system”).

**Features and benefits:**

- Enables compact and sturdy direct mounting of ongoing components at the compact power packs of HAWE Hydraulik
- Intermediate plates enable versatile addition of other components
- Efficient and space saving solution for mounting individual valves or valve banks to single and dual circuit pumps
- Pressure and return filter, pressure limiting valves, switches etc. can be integrated

**Intended applications:**

- Lifting devices
- Machine tools
- Modules for braking or rotor blade adjustment at wind power systems
- Tracking systems for solar panels and parabolic antennas

Nomen-clature:	Connection blocks to the completion of hydraulic power packs
Design:	Add-on valve enabling pipe connection or direct mounting of valve banks
p <sub>max</sub> •	700 bar
Q <sub>max</sub> •	approx. 20 lpm

Design and order coding example

AS3F2	/420	- G24
	Solenoid voltage	12V DC, 24V DC, 230V AC
	Pressure setting (bar)	
Basic type	Type A, B, C see table	

**Options, type A, B, C**

**Type A** with pressure-limiting valve (pre-set or manually adjustable, also with unit approval)

- For direct pipe connection
- To attach valve banks

**Options:**

- Check valve in P gallery
- Prop. pressure-limiting valve
- Return filter, Pressure filter
- Idle circulation valve (solenoid-actuated)
- Shut-off valve, accumulator charging valve

**Type C** without additional elements

- For direct pipe connection

**Options:**

- For pipe connection (pump side) of all type A, B connection blocks  
(Type C15, C16 - connection block with hole pattern of the pump, type C36)

**Type B** with pressure-limiting valve to actuate single- and double-acting cylinders

- For direct pipe connection

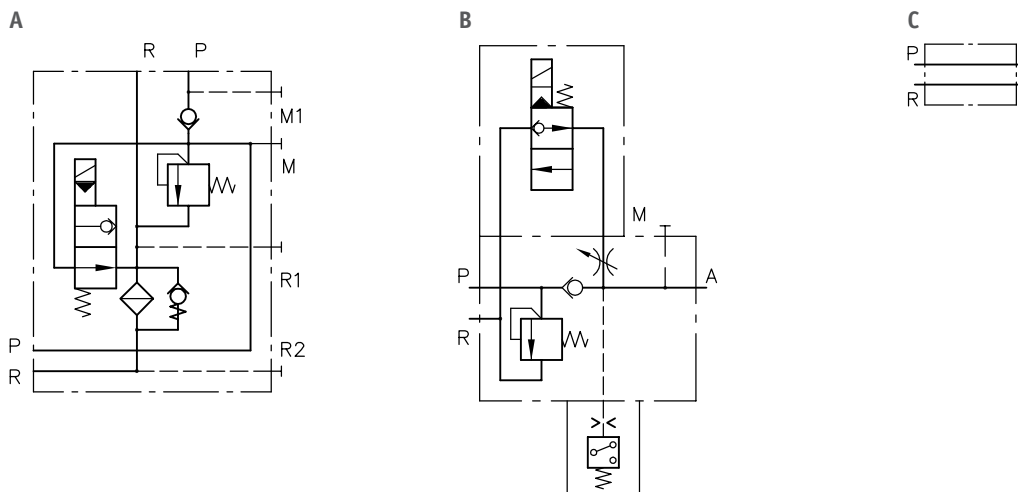

**Options:**

- Check valve in P gallery
- Throttle for regulating the drain speed
- Idle circulation valve open or closed in neutral position
- Pressure switch in P gallery
- Automatic clamping and releasing via the pressure switch (type B..DW)

**Additional versions**

- Connection blocks for dual-stage pumps
- Intermediate blocks for dual-stage pumps type S, V, C30
- Spacer plates for single and dual-circuit pumps type U.
- Additional intermediate block for second pressure stage type V, S

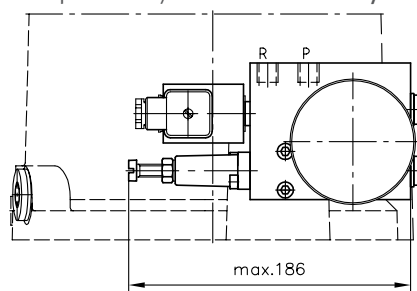

## Function

- Type BA: [Page 34](#)
- Type BVH: [Page 40](#)

# Compact hydraulic power packs

1.1

Valve bank type BA

Thanks to the identical flange pattern of type BA sub-plates, they can be combined very flexibly with type A.. connection blocks. On the pump side, this enables direct mounting (without intermediate plate) to the connection blocks of the compact hydraulic power packs. Directional seated valve banks and directional spool valve banks (e.g. type BWN, BWH, BVH, VB, BVZP, SWR, SWP and SWS) can be flanged to the valve section side. Valves and intermediate plates with standard connection patterns (type NSMD2, NSWP2, NBVP16, NBMD16, NG..-1, NZP16) can be mounted individually. Additional functions for the pump or consumer side (e.g. throttle and throttle check valve, pressure-reducing valve or pressure switch) enable flexible adaptation to changing operating conditions. Hydraulic clamping systems (e.g. in machine tools) with the associated wide range of requirements are the typical application areas.

**Features and benefits:**

- Sub-plates for flexible combination with directional valve types with NG6 (CETOP) standard connection pattern
- Valve bank can be flanged directly to the connection block of a compact hydraulic power pack or connected as a separately arranged valve bank for pipe connection
- Pressure switches and/or any other monitoring elements can be connected directly
- Additional elements, such as orifices, throttles and check valves for P, R, A and B connections can be integrated
- Diaphragm accumulator can be mounted directly

**Intended applications:**

- Clamping systems on machine tools and equipment
- Process control on deforming machine tools
- Brake and rotor adjustment modules on wind turbines

# Compact hydraulic power packs

1.1

Valve bank type BVH

Type BVH valve banks can be very flexibly combined with type A connection blocks. Segments are mounted using a hollow screw in the P gallery. In addition to the seated valve functions, the additional functions in the P and R gallery (e.g. check valve, orifice in P gallery, filter, pressure switch in A gallery) have been integrated into the valve segment. The benefits of this technical design are the flexible bearing and the expansion options that can be easily adapted to the corresponding application at the end user. The main areas of application are hydraulic clamping systems and the machine tool industry.

**Features and benefits:**

- Very flexible expansion options and maintenance of valve banks at end user
- Compact and lighter design

**Intended applications:**

- Clamping systems on machine tools and equipment
- Clamping systems on deforming machine tools
- Brake and rotor adjustment modules on wind turbines

# Standard pumps

1.2

Radial piston pumps type R and RG

The radial piston pumps consist of valve-controlled pump cylinders that are arranged radially. Higher volumetric flows can be achieved by arranging up to 6 radials in parallel. The pump is usually driven by an electric motor, which is connected to the pump via a flange and coupling. The closed pump housing allows for installation in a tank (hydraulic power pack) as well as installation outside a tank (motor pump). The possibility of a radial piston pump with several pressure outlets (several equal or different volumetric flows) is particularly innovative. Type RG with slide bearings is used in extreme operating conditions to increase the service life of the bearings. Compact control systems can be created by mounting various connection blocks and valve banks onto the cover plate of the hydraulic power packs.

Features and benefits:

- High level of efficiency
- Compact design
- Max. 14 separate pressure outlets
- Available from the modular product range as a hydraulic power pack with valve banks

Intended applications:

- Press construction
- Jig construction
- Testing and laboratory devices
- Lubricating systems

Nomenclature:	Radial piston pump
Design:	Individual pump Pump complete with motor Hydraulic power pack
p <sub>max</sub> :	700 bar
Q <sub>max</sub> :	91.2 lpm (V <sub>g</sub> = 64.18 cm³/rev)
V <sub>tank max</sub> :	approx. 470 l

Options

- Fluid level gauge
- Temperature switch
- Float switch

Function, drive

Motor pump

- With/without industrial standard motor (output P<sub>N</sub> in kW)

Hydraulic power packs

- Version with tank, with/without industrial standard motor  
Consumable volume V<sub>cons.</sub> 6 l to 450 l
- Cover plate version (for installation on customer furnished tanks), with/without industrial standard motor
- Combination motor + pump (for installation on customer furnished cover plates and tanks)
- With direct current drive (design 6011)

Basic type, delivery flow [lpm]

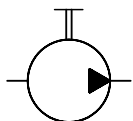

Type R (version with roller bearing) and type RG (version with slide bearing)

Additional versions:

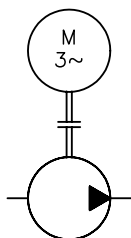

- With several pressure ports
- With separate ports for the flow of one or two pump elements (Q<sub>max</sub> = 4,4 lpm)  
e.g. as control oil supply
- Integrated switch-off valve at two pressure ports

# Standard pumps

1.2

Variable displacement axial piston pumps type V30D and V30E

The variable displacement axial piston pumps type and V30E are designed for open circuits in industrial and mobile hydraulics and operate according to the swash plate principle. A thru-shaft is optionally available to enable the connection of additional variable displacement pumps or an auxiliary pump. In this context, type V30E represents a design according to the most recent findings in pump design. Above all this concerns the optimised self-suction speed, reduced noise emissions and pulsation, increased service life and significantly reduced weight. A wide range of controllers (modular principle) offers the user a wide range of application possibilities. Individual pumps or multiple pumps may be used for hydraulic circuits with several volumetric flows. Robust design, low performance/weight ratio, long service life (large bearing dimensions) and a swash plate angle indicator are amongst the additional benefits.

**Features and benefits:**

- Low noise emissions
- Wide range of controllers
- Full torque available at the second pump in tandem pump applications

**Intended applications:**

- Machines for forestry and agricultural purposes
- Cranes and lifting equipment
- Presses
- Municipal trucks

## Function

Individual pump

Multiple pump

### Controller types:

#### Power controller:

- To restrict the drive torque (L)
- With option to reduce the geom. delivery flow (Lf1)

#### Load-sensing controller:

- For proportional directional spool valve (LS)
- with pressure limitation (LSN)

#### Pressure controller:

- For constant pressure systems (N)
- With remote-control port (P)
- With remote-control port for systems that are very sensitive to vibration (Pb)

#### Flow controller:

- For maintaining a constant flow (Q)
- For maintaining a constant level at higher speeds (Qb)

#### Electro-hydraulic proportional control of the pump:

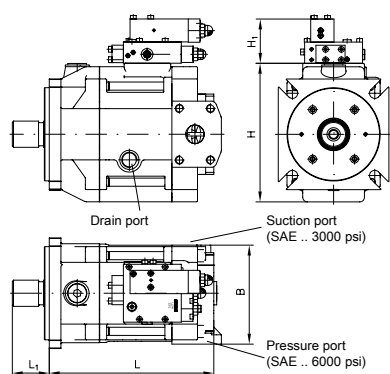

- For continuous delivery flow control using an electronic control card (V)

#### Controller:

- With hydraulic proportional control of the delivery flow (VH)

# Standard pumps

1.2

Variable displacement axial piston pump type V60N

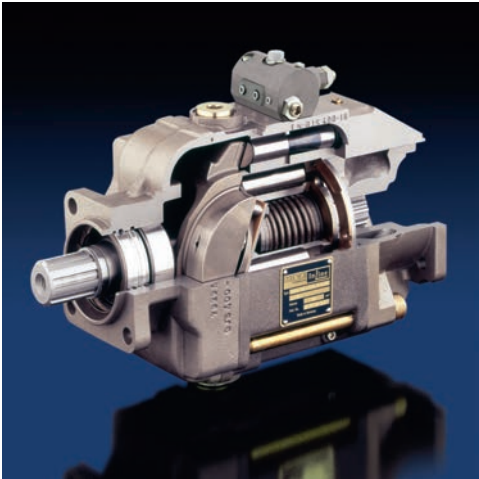

Thanks to its sturdy construction, the variable displacement axial piston pump is designed for direct flange mounting to the power take-off on commercial vehicle gearboxes, or for standard connection using an SAE flange. The benchmark figures for this product are 130 cm<sup>3</sup>/rev and 450 bar end pressure, allowing for a wide range of applications. These are supported by a high self-suction speed rating and low noise level. Variations with thru-shaft for flange mounting additional variable displacement axial piston pumps and auxiliary pumps are also available. Several different controllers offer the user a wide range of application possibilities. Particular advantages with regard to the mutual coordination arise from a combined application of variable displacement axial piston pumps with proportional directional spool valves type PSV and possibly required load-holding valves type LHT and LHDV.

**Features and benefits:**

- Good performance/weight ratio
- High self-suction speed
- Different shaft and flange versions

**Intended applications:**

- Machines for forestry and agricultural purposes
- Cranes and lifting equipment
- Truck-mounted concrete pumps
- Municipal trucks

1.2

Variable displacement axial piston pump type V40M

Thanks to its sturdy construction, the variable displacement axial piston pump is designed for a standard connection using an SAE flange. The benchmark figures for this product are 45 cm³/rev and 320 bar end pressure, allowing for a wide range of applications. These are supported by a high self-suction speed rating and low noise level.

Variations with thru-shaft for flange mounting additional variable displacement axial piston pumps and auxiliary pumps are also available. Several different controllers offer the user a wide range of application possibilities. Particular advantages with regard to the mutual coordination arise from a combined application of variable displacement axial piston pumps with proportional directional spool valves type PSV and possibly required load-holding valves type LHT and LHDV.

Features and benefits:

- Good performance/weight ratio
- High self-suction speed
- Different shaft and flange versions

Intended applications:

- Machines for forestry and agricultural purposes
- Cranes and lifting equipment
- Truck-mounted concrete pumps
- Municipal trucks

	■ Motor pump			
	■ Hydraulic power pack	Gear pump 150 bar	135 lpm	

# Dual stage pump

1.3

Dual stage pumps type RZ

Dual-stage pumps consist of a high-pressure section (radial piston pump, HP) and a directly coupled low-pressure section (gear pump, LP). The pump is usually driven by one single electric motor, which is connected with the dual-stage pump by means of a flange and a coupling. Compact control systems (e.g. for presses) can be created by mounting two-stage valves and valve banks onto the cover plate of hydraulic power packs.

**Features and benefits:**

- Two-stage circuits
- Hydraulic power packs with direct valve mounting

**Intended applications:**

- Presses
- Construction and construction materials machinery

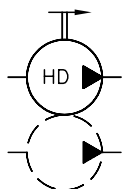

Nomenclature:	Dual stage pump (radial piston and gear pump)

# Air driven hydraulic pumps

1.4

Air driven hydraulic pumps type LP

The hydraulic pumps type LP are reciprocating, valve-controlled plunger pumps that are available in three sizes. They are basically oscillating pneumatic/hydraulic pressure intensifiers. Stroke reversal is controlled automatically. The stroke frequency is dependent on the air pressure set and the current hydraulic counter pressure, and comes to a complete stop when the pressure limit is reached. As an air-driven hydraulic power pack, the tank version of this type of pump can be combined with directional seated valves for use in different applications. This type of pump is used in laboratory presses, jig construction and lubrication technology, for example. Since they are supplied with energy by means of compressed air, they can be used in potentially explosive atmospheres.

**Features and benefits:**

- High operating pressures
- Suitable for explosion-proof systems and equipment  
No electrical energy
- Hydraulic power packs with direct valve mounting

**Intended applications:**

- Construction and construction materials machinery
- Jig construction
- Testing and laboratory equipment

Nomenclature:	Air driven hydraulic pumps

# Hand pumps

1.5

Hand pumps type H, HE, HD and DH

The hand pumps type H are available in single acting and double acting versions. The single acting design pumps in one lever direction only, the reverse motion performs the suction stroke. The double acting design pumps and intakes simultaneously in both lever directions. In one particular design, the suction side may be charged with up to 150 bar. The lever mechanism may be protected from harsh environments if desired, and may incorporate a drain valve (connecting P → S), a pressure limiting valve or a tank. These additional options enable the use of this pump in a wide array of application.

**Features and benefits:**

- Sturdy design
- Hand pumps with integrated tank
- Safety and drain valve

**Intended applications:**

- Ship building
- Mining machinery
- Jigs
- Test and laboratory equipment

# Directional spool valves

## 2.1 Directional spool valves type SG and SP

Directional spool valves type SG and SP can be supplied in 5 different sizes and are available in two versions, either for pipe connection (SG) with and without pressure-limiting valve, or as a manifold mounting valve (SP). They are used to control the direction of movement of consumers such as hydrostatic motors and hydraulic cylinders.

The sturdy design means that these valves are suitable for a wide range of applications, such as ship building or mobile hydraulics. The different actuations can also be used for this purpose.

**Features and benefits:**

- Sturdy design
- Suited for maritime applications
- Various actuations

**Intended applications:**

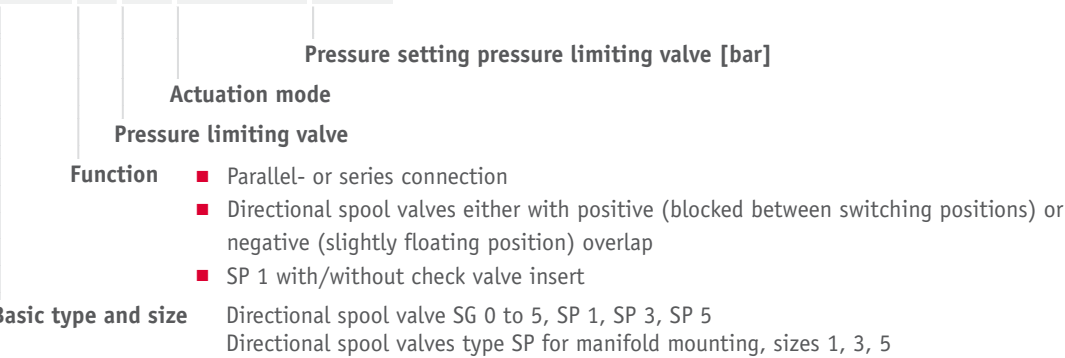

- Mining machinery
- Cranes and lifting equipment
- Ship building
- Road vehicle construction

# Directional spool valves

2.1

Directional spool valves type SW, SWP and NSWP

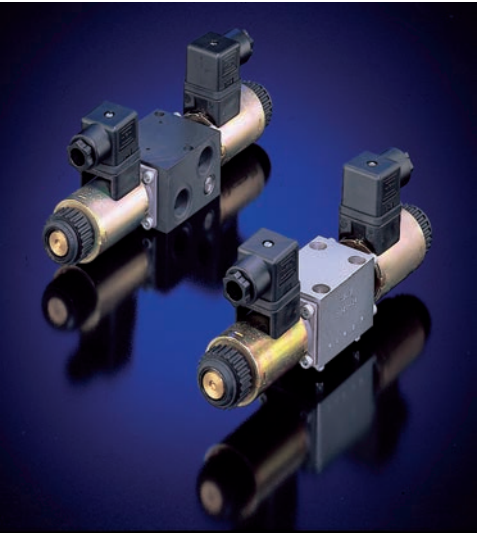

These directional spool valves are designed as individual valves either for pipe connection (type SW) or for manifold mounting (type SWP, NSWP) or as valve bank (type SWP, NSWP). Actuation is via directly acting pressure resistant single stroke solenoids (wet armature); type NSWP may feature twin solenoids enabling two speed rates or prop. solenoids which may be combined also with a stroke limitation. Versions with ATEX-approval are available as well. The individual manifold mounting valves can be combined with sub-plates enabling pipe connection plus an optional pressure limiting valve. The valve sections type NSWP can be combined with various options either on the pump side e.g. check valves, throttles, or orifices plus orifices or restrictor check valves on the consumer side.

**Features and benefits:**

- Compact valve banks
- Simple actuation of proportional functions
- Various versions
- Combinations with NG6 available

**Intended applications:**

- Machine tools - chipping (milling, drilling, turning, grinding)
- Construction and construction materials machinery
- Offshore and marine technology
- Road vehicle construction

# Directional spool valves

2.1

Directional spool valves type SWR and SWS

These directional spool valves are designed as valve bank. Actuation is via directly acting pressure resistant single stroke solenoids (wet armature); type SWS may be controlled also via twin solenoids enabling two speed rates or via prop. solenoids optionally with a stroke limitation. Versions with ATEX-approval are available as well. The valve sections consist of an end plate and a connection block (for pipe connection) or an adapter plate (for direct mounting to the hydraulic power packs), held together by a tension rod.

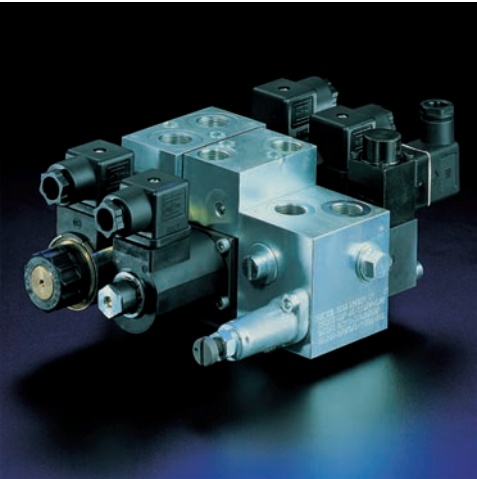

With type SWS, the valve sections can be fitted with additional functions, such as double check valves, load-holding valves or precharge valves etc., in ancillary blocks on the consumer side. It is also possible to integrate a check valve, throttle, orifice or pressure compensator on the pump side. The directional spool valves are primarily used in mobile hydraulics.

**Features and benefits:**

- Combination with lifting modules available (for fork lifts)
- Proportional movements can be controlled independently from the load
- Wide range of ancillary blocks
- Compact

**Intended applications:**

- Material handling (industrial trucks etc.)
- Wind turbines
- Construction and construction materials machinery
- Handling and assembly technology (industrial robots etc.)

# Directional spool valves

2.1

Directional spool valves type HSRL and HSF

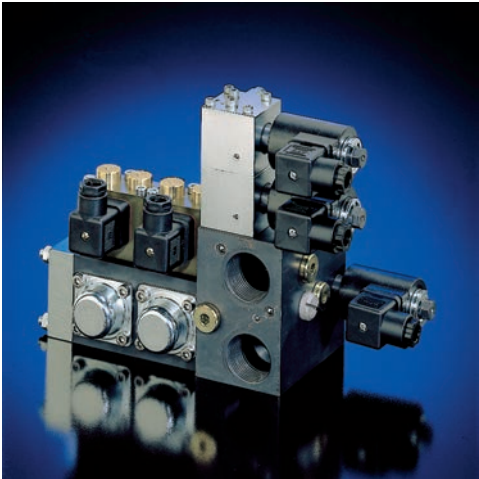

The directional spool valves are available as individual valve for pipe connection (type HSL), manifold mounting (type HSF) or as valve banks (type HSR). These valves are utilized to control the direction of movement of hydraulic consumers. All of them are indirectly electro-hydraulically actuated. The control fluid demand is either taken internally from the main circuit or fed externally from a separate control oil circuit. Harsh switching operations and the risk of decompression surges, particularly in the event of high pressure and large consumer volumes, can be avoided (except with HSRL 3) by using adjustable thread type throttles (adjustable response time). Standard connection blocks or connection blocks with an idle circulation valve, a pressure-limiting valve and integrated pressure-reducing valve are available for series connection. With the HSRL 3 version it is also possible to arbitrarily select different pressure levels.

Features and benefits:

- Soft shifting of high flow
- Suitable for high pressures due to steel housing
- Hydraulic pilot actuation via compact twin solenoids
- Versions conforming ATEX

Intended applications:

- Mining equipment (incl. oil exploration)
- Cranes, lifting-lowering devices
- Construction and construction materials machinery
- Material handling (forklift trucks etc.)

# Directional spool valves

2.1

Manually actuated directional spool valves type DL

The directional spool valve bank type DL is used for smooth manual measuring for general hydraulic systems with single and double-acting consumers as well as stationary and mobile lifting devices.

This measuring process is caused by the bypass pump venting line gradually closing and the consumer line simultaneously opening. The movement begins when the throttling effect in the bypass channel causes the pressure to reach the consumer level.

The DLS directional spool valves are designed for industrial trucks (forklift trucks). The primary function (hydraulic cylinder) is therefore integrated into the connection block. A version with a priority flow divider in the connection block is also available. Different additional functions for the valve sections (e.g. shock valves) extend the range of possible applications.

**Features and benefits:**

- Compact design with up to 10 sections
- Various actuations for manual actuation
- Simple pressure reduction in downstream sections using intermediate plates
- Combinations possible for controlling lifting devices

**Intended applications:**

- Material handling technology (forklift trucks etc.)
- Machines for agricultural and forestry purposes
- Construction and construction materials machinery
- Road vehicle construction

# Directional spool valves

2.1

Proportional directional spool valves type PSL and PSV

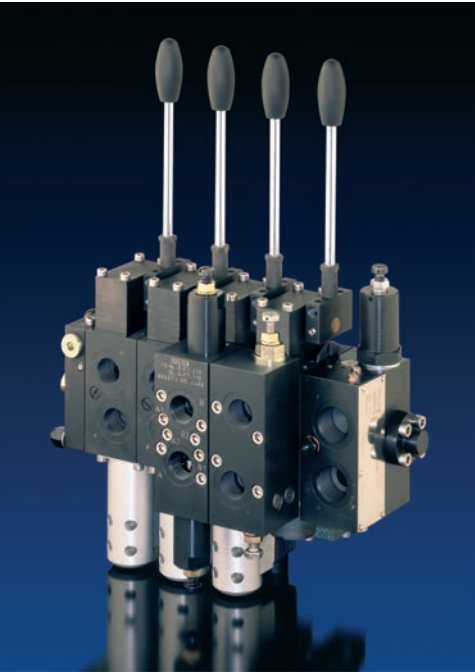

The directional spool valve bank in series design is available in three sizes in type PSL for constant delivery pump systems and type PSV for variable displacement pump systems (pressure/flow controller). It is intended for load-independent, continuous control of the movement speed of hydraulic consumers. Several consumers can be operated simultaneously and independently from each other. The application area of this valve type is mostly in mobile hydraulics (e.g. crane control). Being able to select different maximum volumetric flows for consumer ports A and B as well as the option to use various additional functions (e.g. secondary pressure limitation, function deactivation, in the basic valve, in intermediate plates and ancillary blocks) guarantees optimal adaptation to the respective control tasks.

**Features and benefits:**

- One product for various control functions and volume quantities
- Energy-saving Closed-Center systems
- Compact and lightweight design
- Modular system with wide range of design variants

**Intended applications:**

- Construction/construction material machinery
- Mining machinery (incl. oil production)
- Cranes and lifting equipment
- Machines for forestry and agricultural purposes

Nomenclature:	Prop. directional spool valves as per load-sensing principle

**Solenoid voltage** 12V DC, 24V DC

- Actuated via prop. amplifier or PLVC
- Solenoids with various plug versions
- Explosion proof solenoids

**End plates**

**Valve sections with actuation**

**Size**

**Connection block**

- Ports BSPP or UNF (SAE-12)
- Pressure limiting valve (piloted main pressure limiting valve)
- Suited for both constant and variable displacement pump systems (type PSM)

### Basic type

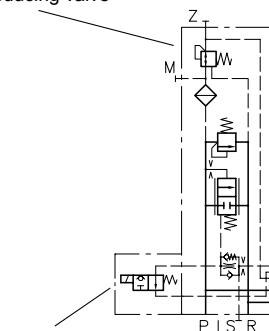

Type PSL (hydraulic oil supply by constant pump), sizes 2, 3 and 5  
 Type PSV (hydraulic oil supply by control pump), sizes 2, 3 and 5  
 Type HMPL (hydraulic oil supply by constant pump) for industrial trucks, sizes 2 and 3  
 Type HMPV (hydraulic oil supply by control pump) for industrial trucks, sizes 2 and 3

## Function

### Connection blocks:

#### PSL

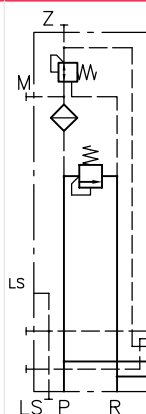

Pilot pressure reducing valve

2/2-way solenoid valve

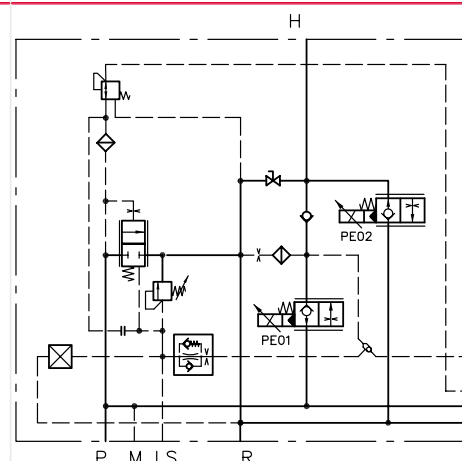

Connection block for constant delivery pump systems with incorporated 3-way controller and pressure-limiting valve

#### PSV

Connection block for control pump systems with or without pressure-limiting valve

#### HMPL (HMPV)

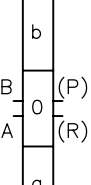

Connection block for constant delivery pump with incorporated proportional seated valve for lifting and lowering

### Additional versions of connection blocks:

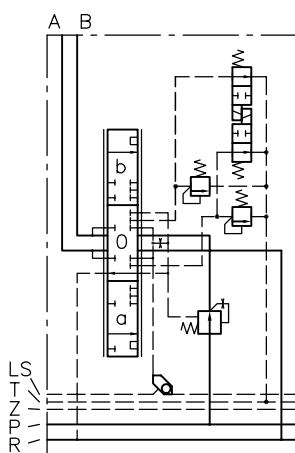

- 2/2-way solenoid valve for randomly switching the pump direction
- Additional damping option of the 3-way/pump controller
- Additional isolation valve to minimise the pump direction resistance
- Version with additional shut-off valve for the pump line, can be switched randomly
- Proportionally adjustable pressure limitation

## Valve sections:

Basic symbols	Switching symbol								
	L	M	F	H	J	B	R	O	G
									

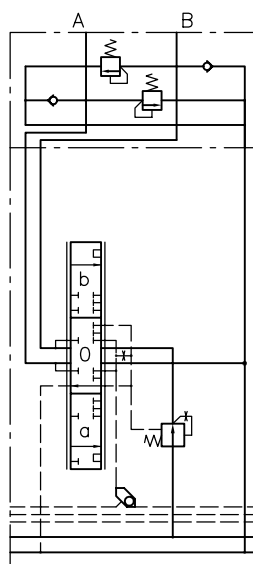

## Versions of valve sections:

- Load pressure signal outputs at A, B; A and B together
- 3/3 directional spool valve with 2-way input and output controller
- Version with and without 2-way input controller
- Function deactivation feature
- Secondary pressure-limiting valves (can be selected for A and/or B)
- Prop. Pressure limitation of individual functions
- Version with ancillary blocks
- Intermediate plates for various additional functions
- Combination of various sizes possible in one valve bank
- Version with ATEX magnet for use in explosive environments
- Version with explosion-proof, intrinsically safe magnets for mining applications

## Additional functions in the ancillary block:

- Shock and servo-suction valves
- Load-holding valves
- Differential circuits
- Check valves with release, no leakage
- Floating and block functions can be switched
- Proportional seated valves as per [D 7490/1](#) for lifting and lowering using plunger cylinders

## Characteristic values for max. volumetric flows:

	Q <sub>A, B</sub>							
Size 2	3	6	10	16	25	40		
Size 3	3	6	10	16	25	40	63	80
Size 5	16	25	40	63	80	120	160	

- Characteristic value corresponds to the max. volumetric flow [lpm] of input controller versions at the consumer ports A and/or B
- Volumetric flows for A and/or B can be selected separately
- Increasing the control pressure enables 60 lpm (size 2), 120 lpm (size 3) and 240 lpm (size 5) per consumer port side.
- Versions with 2-way input controller and check valve function

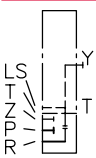

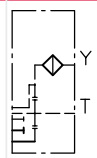

**Actuations:**

Basic type	Brief description	Switching symbol (example)
A	Manual actuation	 Combination of electro-hydraulic and manual actuation
C	Detent (continuous)	
K	Manual actuation via mechanical joystick	
E	Electro-hydraulic actuation	
EA	in combination with manual actuation CAN: Actuation variant with direct CAN actuation	
H, P HA, PA	Hydraulic and pneumatic actuation in combination with manual actuation	
HEA	Combination of H, E and A actuation	

**Intermediate plates:**

- Electrically or hydraulically actuated shut-off valve for all downstream consumers
- With pressure-limiting valve for limiting the operating pressure of all downstream valves
- For random switchable reduction of the volumetric flow of all downstream consumers
- Priority module, size 3

**End plates:**

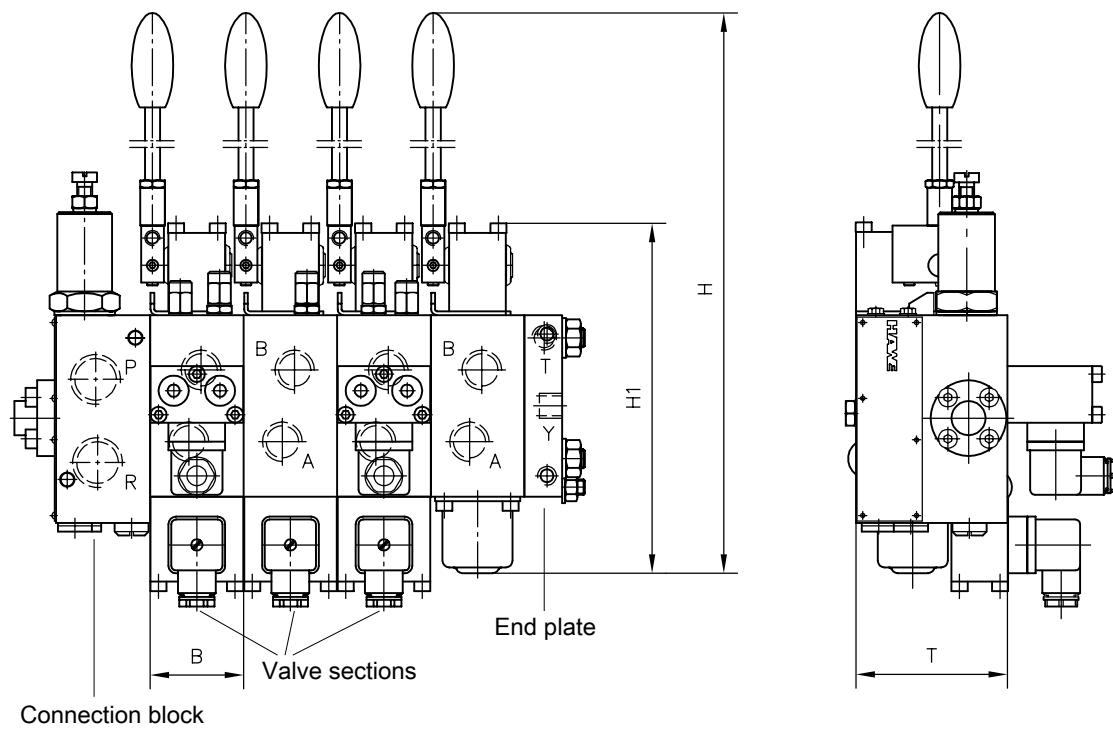

E1	E2
 Standard end plate	 With additional Y-port for LS-input signal

**Additional versions of end plates:**

- End plate with internal leakage oil routing (no T gallery)
- End plates with additional P and R gallery
- Adapter plate to combine size 5 and 3 (coding ZPL 53), size 5 and 2 (coding ZPL 52) and size 3 and 2 (coding ZPL 32)
- End plate with integrated connection block function for dual-pump/dual-circuit systems

# Directional spool valves

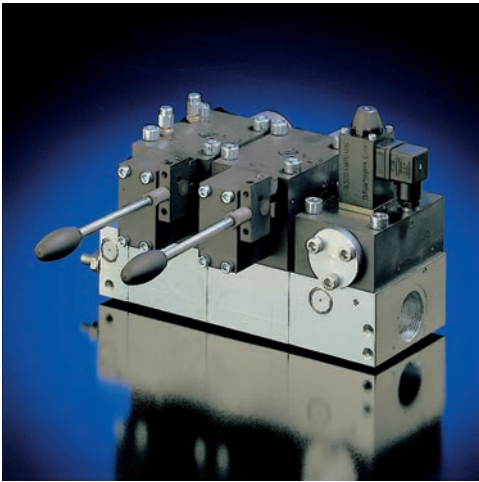

2.1

Prop. directional spool valves type PSLF and PSVF - Manifold mounting design

The directional spool valve bank type PSLF/PSVF consists of valve sections attached via manifolds. Type PSLF is designed for constant delivery pump systems (pressure/flow controller) whereas the type PSVF is for variable displacement pump systems. Both are available in two sizes. They serve to control the direction of motion and provide infinite control of the speed of motion of hydraulic consumers regardless of their load. Several consumers may be operated simultaneously and independently of each other. The main field of application is mobile hydraulics (e.g. boom controls of concrete pumps etc.). Main advantage against type PSL/PSV is simplified servicing as individual valve sections can be replaced easily. The main field of application is mobile hydraulics (e.g. crane controls etc.).

Being able to select different maximum volumetric flows for consumer ports A and B, as well as the option to use various additional functions (e.g. function deactivation) guarantees optimal adaptation to the respective control tasks.

- Features and benefits:**
- Max. flow 1000 lpm at 420 bar
  - Rear side ports for easy access to valves, even in small installation spaces
  - Flange construction can be combined across all sizes with fast valve replacement
  - Simultaneous operation of several functions at full speed
- Intended applications:**
- Construction machinery and machines for building materials
  - Crane and lifting equipment
  - Offshore and marine technology
  - Mining machinery

- G24

Solenoid voltage

12V DC, 24V DC

- Operated using a proportional amplifier or PLVC
- Magnets with different plug versions
- Explosion-proof magnets

End plates

Valve sections with actuation

Size

Connection block

- Port G or UNF (SAE-12)
- Pressure-limiting valve (pilot-controlled main pressure-limiting valve) in connection block

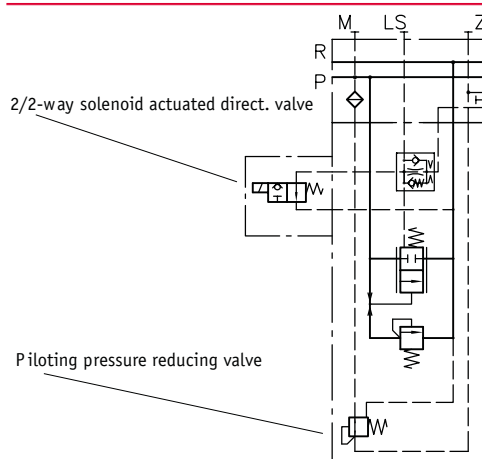

Basic type

Type PSLF (supply via constant pump),  
Type PSVF (supply via variable displacement pump),  
size 3, 5 and 7

## Function

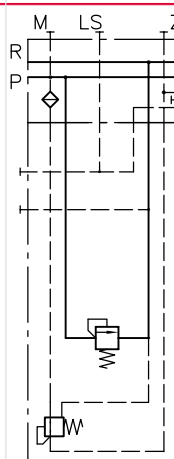

### Connection blocks:

#### PSLF

Connection block for constant delivery pump systems with incorporated 3-way flow controller and pressure limiting valve

#### PSVF

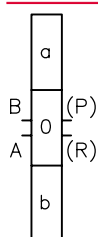

Connection block for variable displacement pump systems with or without pressure limiting valve

### Additional versions of connection blocks:

- 2/2-way solenoid actuated directional valve for arbitrary idle pump circulation
- Additional damping of the 3-way flow controller or pump controller

### Valve sections:

#### Basic symbol

#### Symbol

	L	M	F	H	J	B	R	O	G

### Versions of valve sections:

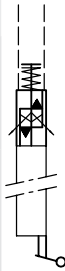

- Load pressure signal outputs at A, B; A and B together
- Version with and without 2-way input controller
- Function deactivation
- Secondary pressure-limiting valves (can be individually selected for A and/or B)
- Prop. pressure limitation of individual functions
- Sub-plates with different additional functions
- Combination of various sizes possible in one valve bank
- Version with ATEX magnet for use in explosive areas
- Version with explosion-proof, intrinsically safe magnets for mining applications

## Coding for max. consumer flow:

	<b>Q<sub>A, B</sub></b>							
<b>Size 3</b>	3	6	10	16	25	40	63	80
<b>Size 5</b>	16	25	40	63	80	120	160	
<b>Size 7</b>	120	160	250	320	400			

- Characteristic value corresponds to the max. volumetric flow (lpm) at the consumer ports A or B for the version with input controller
- Volumetric flows for A and/or B can be selected individually
- Increasing the control pressure enables 60 lpm (size 2), 120 lpm (size 3) and 240 lpm (size 5) per consumer port side.
- Version with 2-way input controller and check valve function

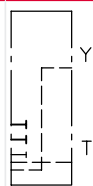

## Actuations:

Basic type	Brief description	Symbol (example)
<b>A</b>	Manual actuation	
<b>C</b>	Detent (stepless)	
<b>E</b>	Electro-hydraulic actuation	
<b>EA</b>	in combination with manual actuation	
<b>H, P</b>	Hydraulic and pneumatic actuation	
<b>HA, PA</b>	in combination with manual actuation	
<b>HEA</b>	Combination of actuation H, E, and A	

For combination of electro-hydraulic and manual actuation

**End plates:**
**E1**

End plate (std. )

**E2**

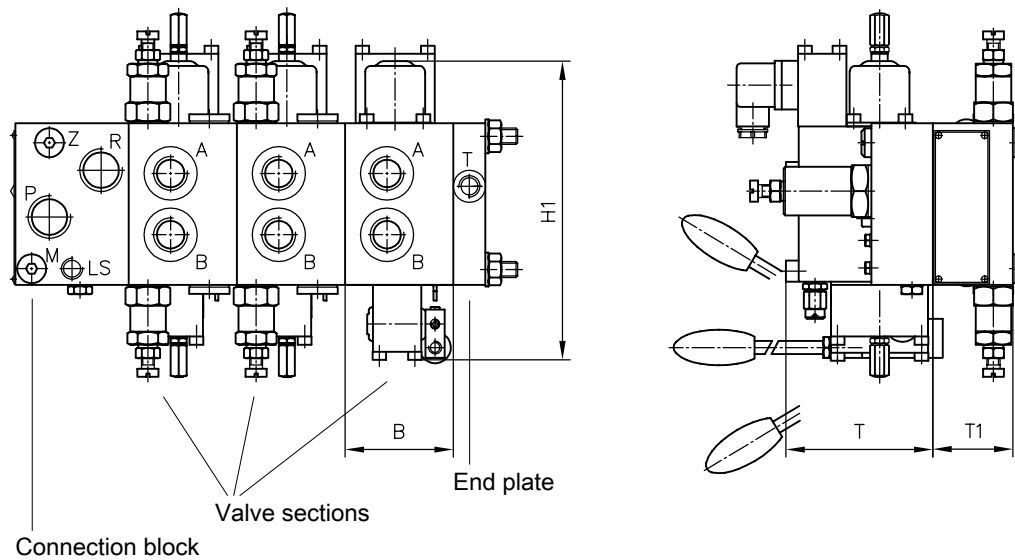

With additional Y-port for LS-input signal

**Additional versions of end plates:**

- End plate with internal drain line (without T-port)
- End plates with an additional port R
- Adapter plate enabling combination of size 5 with size 3 (coding ZPL 53)

# Directional spool valve

2.1

Clamping modules type NSMD2

The clamping modules type NSMD2 are used to actuate power-operated clamping devices such as hydraulically actuated hollow or solid clamping cylinders for automatic lathes. They are available as manifold mounting valves with a standard connection diagram according to DIN 24340-A6. The clamp/release functions of the clamping cylinder, pressure control and, if required, the electrical pressure monitoring are combined in one device. The clamping pressure at the consumer side A or A and B and the pressure switch can be adjusted simultaneously with a manual, mechanical or electro-proportional adjustment device. A special safety circuit monitors the switching position of the valve. 4/3- or 4/2-way directional functions with spring-centred actuation, the latter also with detent actuation, allows for adjustment to the respective application.

The throttling options in the spool end position as well as the rapid and creeping movements are available as an additional function for one or both consumer ports.

Features and benefits:

- Directional valve, pressure-reducing valve and pressure switch in one device
- Adjustment of pressure-reducing valve and pressure switch with an adjustment device (manual or electro-proportional)
- The controlled pressure is picked up directly at the consumer port
- Valve with connection diagram according to DIN 24340-A4

Intended applications:

- Machine tools (cutting)
- Machine tools (non-cutting) - forming and cutting
- Handling and mounting technology (industrial robots, etc.)

## Function

### Basic symbols

#### D, E, G, D1, E1, G1

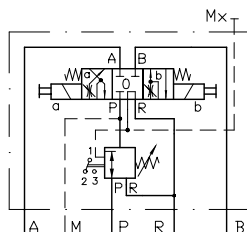

### Symbols

D	E	G
D1	E1	G1
B, W, K	B1, W1, K1	

### Further functions:

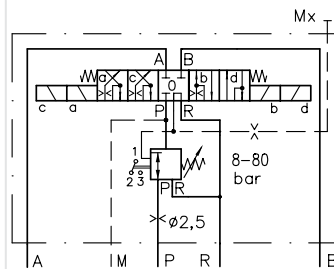

#### G1/MD

Pressure reducing function and throttle in switching positions a and b

#### G/MM6

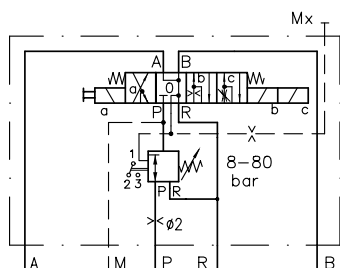

Rapid traverse and creeping in both directions

#### G/MMDA7

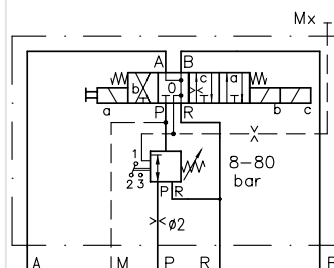

Rapid traverse and creeping in one direction featuring also a limitation for rapid traverse (switching position a, c) rapid traverse in opposing direction (switching position b)

Switching position a, speed limitation is possible by means of a throttle with pressure reduction and pressure monitoring

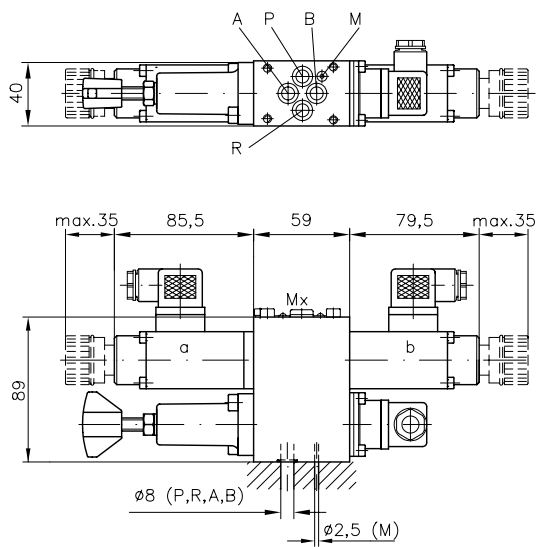

#### G/MMA7

Switching position with fixed rapid traverse speed without pressure reduction and pressure monitoring.

# Seated valves

## 2.2 Directional seated valves with various actuations

These directional seated valves with various actuation modes comprise manifold mounting valves that use spring-loaded balls as valve elements and therefore do not show any leakage. The actuation element used moves the valve to the appropriate switching position using an angled lever and tappet.

The basic versions are designed as 2/2- and 3/2-way directional valves. 3/3- and 4/3-way functions are possible if two valves are housed in one valve block, whereas 4/2-way functions require an additional intermediate plate. The variants of size G...-22 can be used as a reinforced version for fluctuating, pulsating continuous loading and high switching frequency in the upper pressure range.

Connection blocks can be flange-mounted to incorporate the valves into the pipe systems. Optional additional functions in the connection blocks (e.g. pressure-limiting or bypass check valve) extend the range of applications of this valve type. It is possible to combine several valves connected in parallel in one valve bank (type VB).

### Features and benefits:

- Zero-leakage ball valve construction with high switching reliability
- Solenoid, pressure, mechanical or manual actuation
- Low shifting forces and gentle, smooth switching
- Operating pressures up to 700 bar

### Intended applications:

- Machine tools (cutting and non-cutting)
- Clamping equipment, punching tools, jigs
- Rubber and plastics machinery
- Oil hydraulics and pneumatics

<b>Nomenclature:</b>	Directional seated valve, zero leakage

# Seated valves

## 2.2 Directional seated valve bank type VB

The valve bank type VB consists of a connection block (with ports P and R), the directional seated valves (acc. to D 7300) installed on sub-plates and connected in parallel plus the end plate. The whole valve bank is held together with one or two tension rods.

Through selection of the sub-plate, different symbols can be achieved with the individual valves, including in conjunction with additional functions (e.g. pressure switches in the consumer channel). These valve banks may be either directly flange-mounted to a pipe system via a connection block or installed directly onto hydraulic power packs (type HK, HC, MP, MPN and KA) using an adapter plate.

Various end plates (e.g. with pressure switch in the P gallery or accumulator drain valve) extend the range of possible applications.

Particularly in conjunction with hydraulic power packs, the compact design enables hydraulic control systems for high pressure and with low spatial requirements to be achieved.

### Features and benefits:

- Compact hydraulic controls for high pressure
- Combination with compact hydraulic power packs result in cost efficient turn-key solutions
- Elimination of time-consuming installation due to integrated hydraulic power packs
- Simple repairs thanks to modular structure of the systems

### Intended applications:

- Machine tools (chipping and non-chipping)
- Clamping, punching and jigs
- Rubber and plastics machinery
- Oil hydraulics and pneumatics

# Seated valves

## 2.2 Directional seated valves type WN and WH

These directional seated valves type WN and WH use spring loaded balls as valve elements and therefore do not show any leakage. They are manifold mounting and are available in four sizes. These valves are very compact as the functional valve parts are partly integrated in the solenoid body. The basic versions are designed as 2/2- and 3/2-way directional valves. Whereas 3/3- , 4/3-way functions require two valves to be installed on one valve sub-plate.

Connection blocks can be flange-mounted to incorporate the valves into the pipe systems. Optional additional functions in the connection blocks (e.g. pressure-limiting or bypass check valve) extend the range of applications of this valve type. By combining two valves in one connection block, 3/3- and 4/3-way functions can be achieved.

The type WN (size 1 only) has a simpler design than the WH types (no moving seals and no separate solenoid discharge). Therefore the permissible operating pressure for these more cost-effective variants is lower than for the type WH.

It is possible to combine several valves connected in parallel in one valve bank (type BWN and BWH).

**Features and benefits:**

- Excellent price/performance ratio
- Compact design
- Directional seated valves with zero leakage
- Solenoid version with 8-watt technology

**Intended applications:**

- Machines for forestry and agricultural purposes
- Clamping, punching and jigs
- Clamping equipment, punching tools, jigs
- Process engineering systems

# Seated valves

2.2

Directional seated valve bank type BWH and BWN

The valve bank types BWN and BWH consist of a connection block (with ports P and R), the directional seated valves types BWN and BWH installed on sub-plates and connected in parallel plus the end plate. The whole valve bank is held together with one tension rod.

Through selection of the sub-plate, different symbols can be achieved with the individual valves, including in conjunction with additional functions (e.g. pressure switches or pressure-limiting valves in the consumer channel). These valve banks may be either directly flange-mounted to a pipe system via a connection block (with or without pressure-limiting valve) or installed directly onto hydraulic power packs (type HK, HC, MP, MPN, KA and NPC) using an adapter plate. Various end plates (e.g. with pressure switch in the P gallery or accumulator drain valve) extend the range of possible applications.

**Features and benefits:**

- Modular concept
- Adapter plates for flange-mounting on hydraulic power packs or combination with other valve types
- With the valve bank version, option to incorporate additional functions in the sub-plate, such as pressure-limiting valves, pressure switches etc.
- Energy-efficient solutions in connection with hydraulic accumulators

**Intended applications:**

- Machine tools (chipping and non-chipping)
- Rubber and plastic machinery
- Mining machinery (incl. oil production)
- Rubber and plastics machinery

# Seated valves

2.2

Directional seated valves type VZP

These type VZP use spring-loaded balls or cones as valve elements and therefore do not show any leakage.

The twin layout of the 3/2- and 2/2-way directional seated valves means that all functional elements for valve function and actuation share one housing, making them very compact.

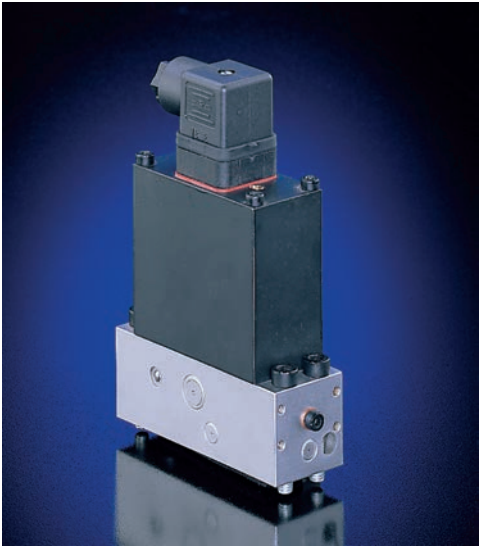

Depending on pairing, these valves can fulfil either one 4/4-, 4/3-, 3/3-way function or two independent 3/2- and 2/2-way functions. When compared with individual valves for manifold mounting of conventional layout, the twin design is more advantageous due to lower spatial requirements and the possibility to directly mount pressure switches for monitoring the consumer pressure. This compact design offers particular advantages in type BVZP valve banks consisting of several valves of this type connected in parallel.

Features and benefits:

- Good price-performance ratio
- Max. operating pressures up to 450 bar
- Adapter plates for flange-mounting on compact hydraulic power packs
- Option to incorporate additional functions in the sub-plate, such as pressure switches, throttle and check valve combinations etc.

Intended applications:

- Machine tools (cutting and non-cutting)
- Mining machinery (incl. oil production)
- Clamping equipment, punching tools, jigs
- Rubber and plastics machinery

# Seated valves

2.2

Directional seated valve bank type BVZP

The valve bank type BVZP consist of a connection block (with ports P and R), the directional seated valves type VZP installed on sub-plates and connected in parallel plus the end plate. The whole valve bank is held together with two tension rods. Depending on the type, the sub-plate feature optional functions e.g. restrictor check valves and/or pressure reduction valves covering only the corresponding valve section. Connection blocks with or without pressure-limiting valve can be mounted for pipe connection. Combination with hydraulic power packs (type HK, HC, MP, MPN and KA) and other directional valve types is achieved using appropriate adapter plates. Various end plates (e.g. with and without pressure switch in the P gallery) extend the range of possible applications. Particularly in conjunction with hydraulic power packs, the compact design enables complete hydraulic control systems with low spatial requirements to be achieved.

**Features and benefits:**

- Excellent price/performance ratio
- Max. operating pressure 450 bar
- Adapter plates for flange-mounting on compact hydraulic power packs
- Option to incorporate additional functions in the sub-plate, such as pressure switches, throttle and check valve combinations etc.

**Intended applications:**

- Machine tools (chipping and non-chipping)
- Mining (incl. oil production)
- Clamping equipment, punching tools, jigs
- Rubber and plastics machinery

### Options for the valve section:

- Sub-plate with throttle and restrictor check valves in the consumer port
- Valve section with 4/2-way function, directional spool valve
- Pressure reducing valve reducing the pressure for one valve section only (connected in parallel)
- Pressure reducing valve reducing the pressure for all subsequent valves (connected in series)
- Pressure reducing valve with orifice/throttle and by-pass check valve in the consumer port

### Additional versions:

- Individual valve with orifice in the gallery P and/or return pressure stop in the return gallery
- Individual valve type WH with sub-plate, may be integrated in a valve bank
- Sub-plate for 4/3-way valves with ancillary blocks at the consumer side featuring a pressure reducing valve with tracked pressure switch and throttles

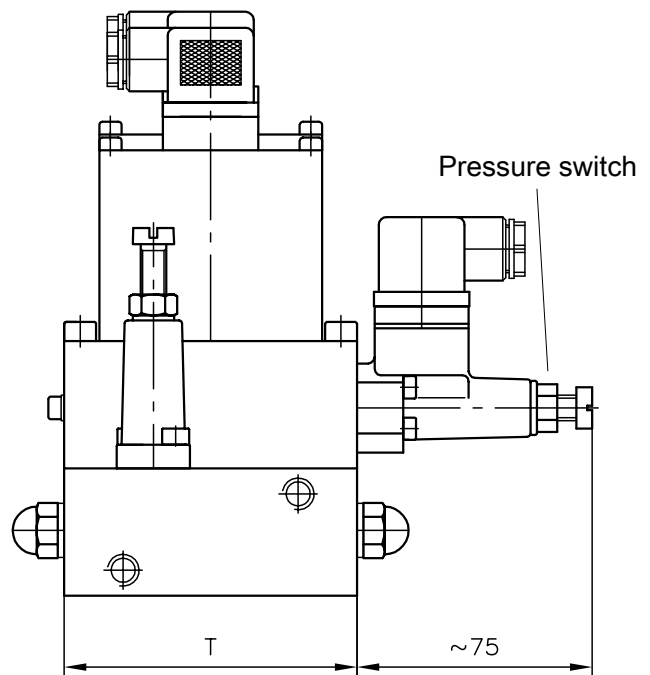

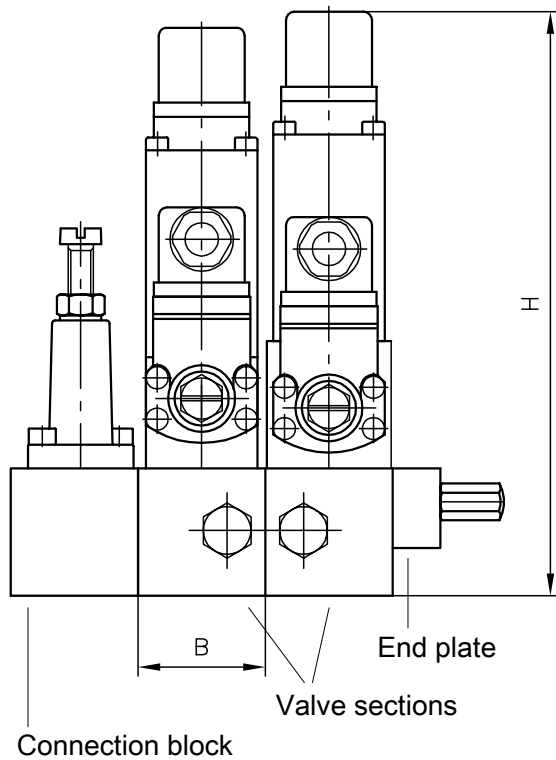

**End plates:**

# Directional seated valves

## 2.2 2/2-way directional seated valve cartridges type EM, EMP and EMC

These 2/2-way ball seated directional valves are either directly or pilot actuated by a solenoid. With the directly actuated version the valve passage is opened or closed by a cone whereas with the piloted a piloting duct of a stepped piston is opened or closed generating a pressure difference at the opposing facial areas of the piston forcing it in the open or closed position. Type EMP is a proportional valve, acting like a throttle but with zero leakage in blocked position. The dampened version will increase the switching time for on/off controls (hydraulic ramp). The wet armature solenoids for the valve actuation are pressure resistant, where all moving internal parts are flushed by oil. There is a wide range of connection blocks either for pipe connection or for banjo bolt mounting, which may feature optional elements such as drain valve, by-pass throttle, pressure switch, 2-way flow control valve etc.

**Features and benefits:**

- Zero leakage in blocked state
- Directly switching up to approx. 3 lpm and piloted up to 160 lpm
- Minimized back pressure even at high flows
- Long service life due to hardened valve seats

**Intended applications:**

- Cranes and lifting equipment
- Road construction industry
- Materials handling, industrial trucks etc.
- Handling and assembly robots, etc.

# Seated valves

2.2

Directional seated valves type BVG, BVE, BVP and NBVP

The group of directional seated valves type BVG, BVE and BVP includes 2/2- and 3/2-way directional valves in two sizes. Size 1 valves feature a version with standard connection diagram NG 6 (type NBVP) and a version with 4/3-way function. They are designed as zero-leakage, cone seated valves. All ports are equally pressure-resistant due to an internal static pressure balance. The valves can be connected via pipes (type BVG), screwed onto self-manufactured base plates (type BVP) and industrial standard connection plates (type NBVP) or screwed into self-manufactured valve blocks as a screw-in valve (type BVE). The various actuation modes (type BVE with solenoid actuation only) enable use of these valves in a wide range of applications. Additional elements for ports P, R, A and B (e.g. orifices, check valves and restrictor check valves) can be incorporated in the valve block to tailor the range of possible applications to the special requirements of the customer.

**Features and benefits:**

- Zero-leakage, cone seated construction
- Pressure switch can be directly mounted
- Complete system solution with compact hydraulic power packs made from the modular system
- ATEX-compliant version

**Intended applications:**

- Machine tools
- Woodworking and processing machinery
- Testing machinery
- Jig construction

# Seated valves

## 2.2 Directional seated valves type VP

Type VP 1 valves are designed as zero-leakage, cone-seated valves and can be used as 2/2-, 3/2- and 4/2-way directional valves. The internal pressure balance enables free selection of the flow direction and maximum pressure resistance of all ports. Due to the air-switching actuation, there is no risk of interaction between actuation elements and the medium used. No sticking or resinification as a result of increased temperatures is possible.

The preferred area of application is hydraulic lubrication systems that use high-viscosity grease or oils. Other fluids in the relevant viscosity range can also be considered provided they have the appropriate seal compatibility.

**Features and benefits:**

- Freely selectable flow direction
- No interaction between actuation elements and medium
- No sticking or resinification as a result of increased temperatures is possible.

**Intended applications:**

- Lubricating systems
- Mining machinery
- Construction and construction materials machinery
- Handling and assembly technology

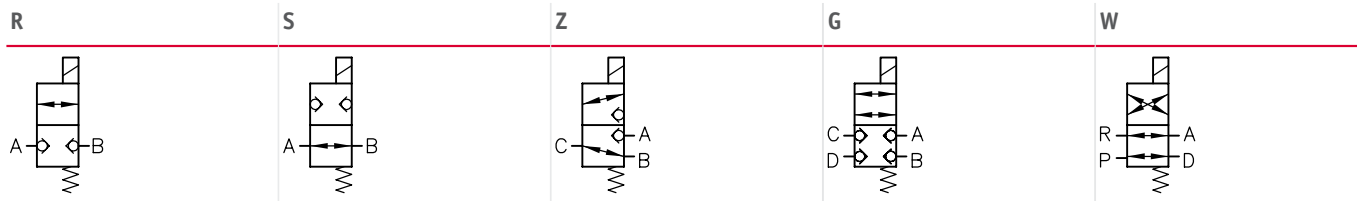

<b>Nomenclature:</b>	Directional seated valve, zero leakage

# Seated valves

2.2

Lifting/lowering valves type HSV

The lifting/lowering valves type HSV are preferentially used for controlling lifting equipment with single-acting cylinders. The valve block combines the functions of a 2/2-way directional seated valve with solenoid actuation for lowering the raised load. It is optionally available with an adjustable throttle to limit the lowering speed or a 2-way flow control valve to guarantee the lowering speed is as load-independent as possible. A pressure-limiting valve is incorporated to limit the permissible load. An additionally installed check valve prevents uncontrolled lowering of the load. Flange-mounting on self-manufactured connection plates is possible.

Features and benefits:

- Optimal control of lifting and lowering function
- High pressures up to 400 bar
- Zero leakage to prevent unwanted lowering of loads and platforms
- Integrated overpressure protection

Intended applications:

- Cranes and lifting equipment
- Materials handling
- Road vehicle construction
- Mining machinery

# Seated valves

2.2

Switch units (press control valves) type CR

The switch units type CR, available in three sizes, are intended for the control of bottom and top ram presses, which are driven by dual stage pumps. They consist of a 2/2-way ball seated directional valve, a ball type check valve and pressure valves. Low pressure and high pressure circuit are joined during rapid transverse, as soon as the set pressure is achieved or exceeded the low pressure circuit is switched in idle circulation mode, whereas the high pressure circuit continues feeding the press cylinder. An automatic pre-release ensures decompression without pressure surges. These switch units are designed for direct mounting onto our hydraulic power packs type MP and RZ.

Features and benefits:

- Optimized for the controls of bottom ram presses
- Smooth, gentle switching
- No pressure drop during press operation due to zero leakage
- Fully automatic switching of the low-pressure pump to circulation

Intended applications:

- Machine tools (presses)
- Woodworking and processing machinery
- Printing and paper technology
- Foodstuff and packaging machinery

# Seated valves

2.2

Lifting modules and lifting/lowering valves type HMB, HMC, HMT, and HSV, HZV etc.

They are a combination of different valves (flow control valves, throttles, directional valves) for main lift and, in some cases, other additional functions. The lifting modules and lifting/lowering valves are for controlling lifting devices, especially high-rack stackers, order pickers, reach trucks and mobile lifting units. The design of the internal control system is extremely flexible. This enables solutions that are not only precisely tailored to the relevant drive concept (fixed or variable displacement pump) and the customer-specific application, but also affordable.

Control systems for secondary or additional functions can be achieved using directional seated valves or directional spool valves (type SWR or SWS). These valves are directly flange-mounted to the main valve in the form of mounting blocks, therefore making the whole valve combination extremely space-saving.

Features and benefits:

- Flexible design for fixed or variable displacement pump systems
- Low spatial requirements due to steel design
- Flexible combination with directional valves

Intended applications:

- Materials handling (industrial trucks etc.)
- Cranes and lifting equipment
- Road vehicle construction

Nomenclature:	Valve combination according to type consisting of: <ul style="list-style-type: none"><li>■ 3-way flow control valves</li><li>■ 2-way flow control valves</li><li>■ 2-way seated valves</li><li>■ Directional spool functions</li></ul>

# Seated valves

2.2

Directional seated valves type VH, VHR and VHP

The directional seated valves types VH, VHR and VHP operate leakage free and are available in two different sizes. They are operated via a hand lever on an eccentric shaft transferring the switching moment to an actuation pin acting on the valve elements (balls). The actuation either features a detent or is self returning to its idle position. Valve banks type VHR are also available, featuring individual valves (type VH) connected in parallel and held together with tension rods. Valves type VHP size 1 is also available as individual manifold mounting version.

Features and benefits:

- Max. pressure 700 bar (manual actuation)
- Actuation using hand lever with automatic centring in zero position or with notch
- Different arrangements in valve bank possible
- Leakage-free seated valve technology

Intended applications

- Machines for construction and construction material
- Offshore and marine technology
- Process engineering systems
- Oil hydraulics and pneumatics

Nomenclature:	Directional seated valve, zero leakage
Design:	Individual valve for pipe connection Individual valve, manifold mounting, bankable
Actuation:	Manual
p <sub>max</sub> :	500 ... 700 bar
Q <sub>max</sub> :	12 ... 25 lpm

Design and order coding example

VH 1	H1
VHR 1	G1/N1/E1

Function/valve sections with actuation      Hand lever with automatic return (1) or detent (2)

Additional versions:

- Actuation with idle position monitoring via contact switch, available either as indiv. valve or valve bank

Basic type, size      Type VH (Individual valve for pipe connection)  
Type VHP (Individual valve, manifold mounting)  
Type VHR (Valve bank)  
Size 1 and 2

Actuations:

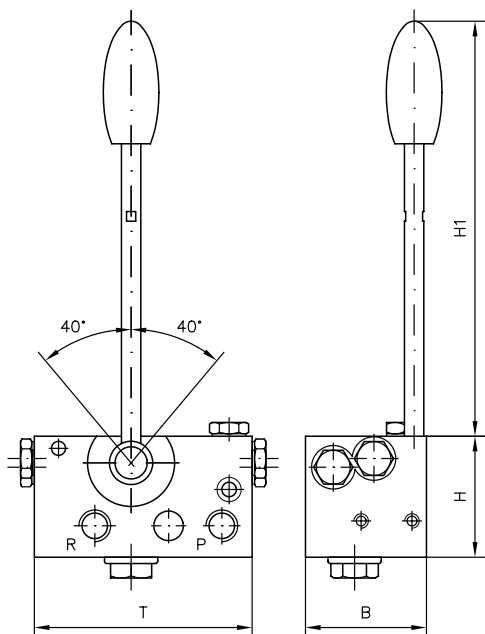

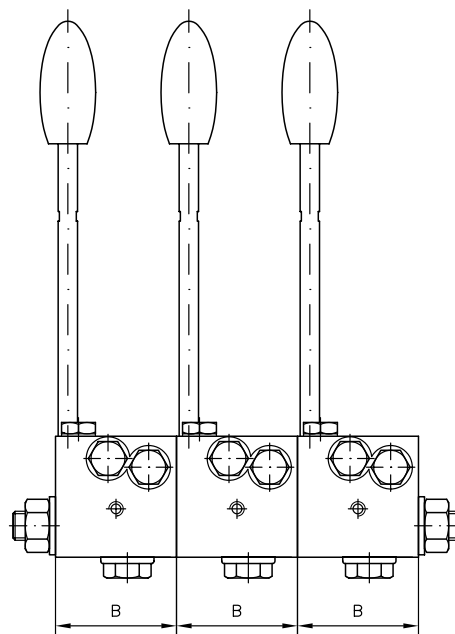

Return spring	Detent	
		Symbol type VHR.. 

- Return spring: The automatic return is limited to operating pressure of 50 bar. The hand lever has to be returned manually at operating pressure between 50 ... 700 bar.

**Function**

# Seated valves

2.2

Shut-off valves type DA and EA

The shut-off valves types DA and EA are of ball seated design and are available in two sizes. They are used in hydraulic systems for blocking the flow in one or both directions. They are available with hand lever or with eccentric shaft for customer furnished hand lever. Both versions can be ordered either with or without detent.

**Features and benefits:**

- Zero leakage blocking of a hydraulic line
- Pressures up to 500 bar manually switchable
- Flows up to 150 lpm
- Single or double-blocking

**Intended applications:**

- Rolling mill equipment
- Shipbuilding
- Construction and construction materials machinery
- Mining machinery

## Pressure valves

## 2.3 Directly controlled pressure limiting and sequence valves type MV, SV

Pressure valves influence the pressure in hydraulic systems.

Pressure-limiting valves (safety or overpressure valve) safeguard the system against excessive pressure or limit the operation pressure. Sequence valves generate a constant pressure difference between the inlet and outlet flow.

A damping device is fitted as standard in the directly controlled valves to ensure quiet operation, but an undamped variant is also available for special operating conditions. Pressure-limiting valves with unit approval and CE mark (type MV.X) are also available.

### Features and benefits:

- Operating pressures up to 700 bar
- Various adjustment options
- Numerous configurations

**Intended applications:**

- General hydraulic systems
- Test benches
- Hydraulic tools

<b>Nomenclature:</b>	Pressure limiting valve, sequence valves (directly controlled)

# Pressure valves

2.3

Pressure limiting valves type CMV and CSV

Pressure valves influence the pressure in hydraulic systems. Pressure-limiting valves (safety or overpressure valve) safeguard the system against excessive pressure or limit the operation pressure. Sequence valves generate a constant pressure difference between the inlet and outlet flow, where the flow in the opposite direction (return flow) is free via a bypass check valve.

One advantage of the valves described here is the easily produced mounting hole (see dimensions). Type CMV is also available as a CE-marked pressure-limiting valve with unit approval, e.g. as a safety valve for accumulators in accordance with Pressure Equipment Directive 97/23 EC. Types CMVZ and CSVZ are not influenced by the pressure conditions downstream and are therefore suitable for use in loss-free sequence control systems.

Features and benefits:

- Operating pressures up to 500 bar
- Various adjustment options
- Easily produced mounting hole

Intended applications:

- General hydraulic systems
- Test benches
- Hydraulic tools

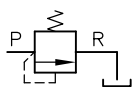

Nomenclature:	Pressure limiting valve, sequence valves (directly controlled)

# Pressure valves

## 2.3 Piloted pressure limiting valves type DV, AS etc.

Pressure valves influence the pressure in hydraulic systems. Pressure-limiting valves (safety or overpressure valve) safeguard the system against excessive pressure or limit the operation pressure. Sequence valves generate a constant pressure difference between the inlet and outlet flow. Follow-up valves (release valves) block the flow until a set pressure value is reached (free flow once this value is exceeded). Compared with pressure valves of the type DV, the types AS and AE have an additional check valve in the consumer port.

- Features and benefits:**
- Various adjustment options
  - Various additional functions

- Intended applications:**
- General hydraulic systems
  - Test benches

# Pressure valves

## 2.3 Sequence valves with check valve type VR

Pressure valves influence the pressure within a hydraulic system. The type illustrated below is a sequence valves which generates a constant pressure difference between inlet and outlet of the flow. The flow in opposite direction (reflow) is unhindered via a by-pass check valve. This valve shows minor leakage like other spool valves in flow direction  $V \rightarrow F$ . These pre-load valves are used, for example, as drop protection in fork lift trucks, safeguarding the lifting cylinder during lowering to prevent continued travel if the fork accidentally gets caught (accident protection), or preventing undesired oscillations by increasing the back pressure when used as pre-load valve in return pipes.

- Features and benefits:**
- Compact screw-in valve
- Intended applications:**
- Industrial trucks
  - Lifting devices

Nomenclature:	Sequence valve

# Pressure valves

2.3

Proportional pressure limiting valves type PMV and PDV

These pressure limiting valves are electrically remote controlled and rule the hydraulic pressure within the system. These pressure limiting valves are electrically remote controlled and safe guard the system against an excessive pressure whose value can be altered.

The valve series described here are directly controlled (type PMV) or piloted (type PDV). A minimum pressure of 3 bar or more is required for proper functioning of the integrated prop. pressure-reducing valve.

Features and benefits:

- Max. operating pressure 700 bar

Intended applications:

- General hydraulics
- Test benches

# Pressure valves

2.3

Miniature pressure reducing valves type ADC, AM etc.

The task of pressure-reducing valves is to maintain a largely constant outlet pressure despite a higher and changing inlet pressure. These valves are used when a secondary circuit has to be fed with a lower but constant pressure level by a main (primary) oil circuit with a higher and varying pressure level. The valves mentioned here are suitable for the supply of control circuits with low oil consumption. There is a design-related permanent leakage flow, which has to be led back to the tank in a de-pressurized line via port R. A reversal of the flow direction is possible up to approx. 30% of  $Q_{max}$ . A bypass check valve has to be provided for higher reversed flow. These pressure-reducing valves feature an override compensation, i.e. acting like a pressure-limiting valve, if the pressure on the secondary side exceeds the set pressure e.g. due to external forces.

Features and benefits:

- Compact design
- Numerous configurations

Intended applications:

- For control oil supply in pilot circuits

# Pressure valves

## 2.3

### Pressure-reducing valves type CDK, CLK, DK, DLZ and DZ

The task of pressure-reducing valves is to maintain a largely constant outlet pressure despite a higher and changing inlet pressure. These valves are used when a secondary circuit has to be fed with a lower but constant pressure level by a main (primary) oil circuit with a higher and varying pressure level. The valve described here is directly controlled. Compared with conventional, piston-type pressure-reducing valves suffering from leaking oil, where an additional drain port is required, this type is designed according to the 2-way principle, i.e. it has zero leakage when in a closed state. Type CLK has an additional override compensation. A reversal of the flow direction is possible up to approx.  $2 \times Q_{\max}$ .

#### Features and benefits:

- Zero leakage in closed state
- Version with integrated overpressure function
- Easily produced mounting hole

#### Intended applications:

- General hydraulic systems
- Jigs
- Test benches

# Pressure valves

2.3

Miniature proportional pressure reducing valves type PM

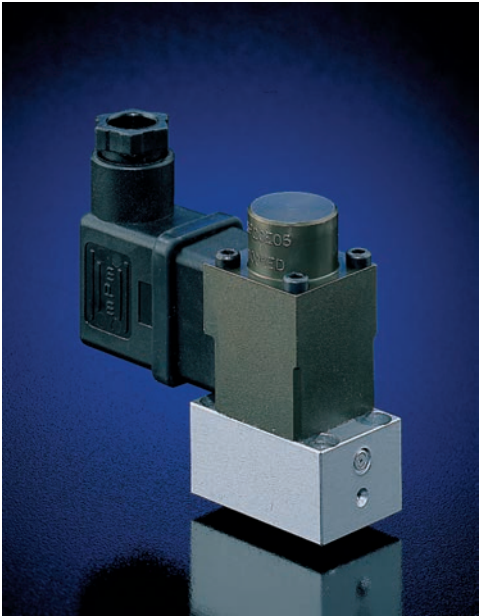

These proportional pressure reducing valves are used for circuits, where other devices i.e. directional spool valves should be controlled with a low flow and varying pressure. The pressure on the secondary side (port A) can be adjusted, independently from the pressure on the primary side, according to an electrical signal. The reduced pressure at port A will change proportional to alternation of the electrical input signal. There is a design related permanent leakage flow apparent at R, which has to be led back to the tank via a depressurized line. These pressure reducing valves feature a override compensation i.e. acting like a pressure limiting valve, if the pressure on the secondary side exceeds the set pressure e.g. due to external forces.

Features and benefits:

- Compact design
- Numerous configurations

Intended applications:

- For control oil supply in piloting circuits

# Pressure valves

2.3

Proportional pressure reducing valves type PDM

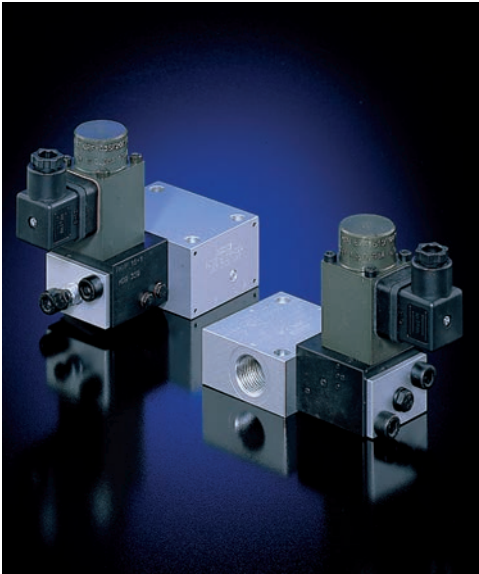

The task of proportional pressure reducing valves in a hydraulic circuit is to maintain a rather constant outlet pressure (port A) despite a higher and changing inlet pressure (port P). They are used when an hydraulic circuit with a higher pressure level (primary side) is to supply another circuit with a lower pressure level (secondary side), without affecting the higher pressure in the primary circuit. There is a design related permanent leakage flow apparent at L, which has to be led back to the tank via a de-pressurized line. A reversal of the direction of flow is possible up to approx. 50% of  $Q_{max}$ . A by-pass check valve has to be provided for higher reversed flow. The pressure reducing valves size 11 and 21/22 feature an override compensation i.e. acting like a pressure limiting valve, if the pressure on the secondary side exceeds the set pressure e.g. due to external forces.

Features and benefits:

- With safety valve function

Intended applications:

- General hydraulics
- Jigs
- Test benches

# Pressure valves

2.3

Circulation valve type CNE

The pressure controlled 2-way directional valve automatically switches one (low pressure) of two circuits feeding a hydraulic system into idle circulation as soon as the adjusted pressure is achieved or exceeded by the high pressure circuit. The valve is retained in this shifting position, enabling idle circulation, via the higher pressure being picked up and transmitted by a control oil duct. This valve also serves as a pressure limiting valve for the low pressure circuit. Contrary to version CNE 2, CNE 21 features an additional thread seal and CNE 22 and 23 a thread seal plus a piston seal. The idle circulation valves type CNE are screw-in valves where the mounting hole can be easily manufactured.

Features and benefits:

- Compact design
- Easily produced mounting hole

Intended applications:

- Accumulator charged systems
- Jigs

Nomen-clature:	2-way circulation valve
Design:	Screw-in valve
Adjustment:	Tool adjustable
p <sub>max</sub> •	500 bar
p <sub>max adjust</sub> •	450 bar
Q <sub>max</sub> •	30 lpm

# Pressure valves

2.3

Two stage valves type NE

Two stage valves are used for hydraulic systems fed by two stage pumps (low and high pressure). They unit the flow from both pumps, automatically switch the low pressure circuit to idle circulation as soon as the adjusted pressure is achieved or exceeded by the high pressure circuit and safeguard both pumps from excessive pressure above the set figures. These valves are intended for use together with 3/3- or 4/3-way directional valves controlling hydraulic cylinders. Bottom ram presses and single acting hydraulic cylinders are better controlled by switch units type CR.

Features and benefits:

- Max. operating pressure 700 bar
- Direct mounting to hydraulic power packs
- Direct combination with valve control

Intended applications:

- Presses
- Test benches
- Hydraulic tools

Nomenclature:	Two stage valve (high pressure (HP) / low pressure (LP) stage)
Design:	Individual valve for pipe connection
Adjustment:	Tool adjustable
p <sub>max</sub> :	500 ... 700 (HP) / 30 ... 80 (LP) bar
Q <sub>max</sub> :	25 (HP) / 180 (LP) lpm

# Pressure valves

2.3

Shut-off valves type LV and ALZ

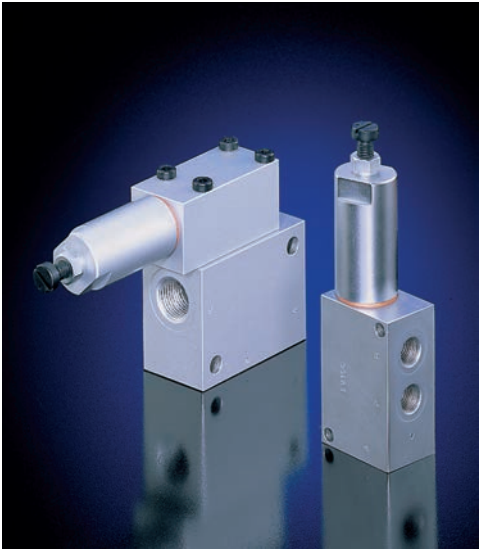

These shut-off valves automatically switch the pump delivery flow into idle circulation as soon as the adjusted pressure is achieved. There is a check valve upstream of the consumer port A preventing any return flow via the port R . The idle circulation switching position is interrupted as soon as the pressure in the consumer port drops approx. 13% under the set pressure figure. The self controlled valves type LV do not require any flow pulsation whereas type ALZ is a piloting valve. Both types are mostly used as accumulator charge valves, and should be installed as near to the pump as possible.

Features and benefits:

- Various means of adjustment
- Various additional functions

Intended applications:

- General hydraulics
- Test benches

Nomen-clature:	Shut-off valve (idle circulation valve, direct controlled or piloted)
Design:	Individual valve for pipe connection Individual valve Manifold mounting
Adjustment:	Tool adjustable manually adjustable
p <sub>max</sub> :	350 bar

# Pressure valves

## 2.3 Pressure controlled shut-off valves type DSV and CDSV

These pressure-controlled shut-off valves in the seated valve version block the flow to consumers located downstream without any leakage as soon as the set pressure value is reached or exceeded in the consumer line B. The valves will open again if the pressure on the inlet side A drops below the set value defined by the spring tension. While type DSV is designed for manifold mounting or pipe connection, type CDSV is a screw-in valve with easily machined mounting holes. It is frequently used to safeguard pressure gauges, for example.

- Features and benefits:**
- Various adjustment options
  - Various additional functions

- Intended applications:**
- General hydraulic systems
  - Test benches
  - (Pressure gauge) protection valve

# Pressure valves

2.3

Load holding valves type LHK, LHDV, and LHT

Load-holding valves are pressure valves that always act on the outlet side of double-acting consumers. They block the outlet duct with their set pressure (pressure setting approx. 15% above the max. load pressure), generating a counter force to a pushing (negative) load. Therefore the pump will have to feed the inflow side with residual pressure in order to drop the load.

Type LHK valves are intended for use in applications that are not particularly prone to oscillations.

Load-holding valves of type LHT and type LHDV featuring special damping properties are especially well suited for applications together with prop. directional spool valves ("Load Sensing" directional spool valves) e.g. type PSL/PSV.

Many additional options are available such as shock valves and shuttle valves with or without restrictor check valve (delayed release of hydraulic brakes) etc.

Features and benefits:

- Operating pressures up to 420 bar
- Various adjustment options
- Various configurations

Intended applications:

- Cranes
- Construction machinery
- Lifting devices

Nomenclature:	Load holding valve (over center valve, for one sided or alternating load direction) Single or twin valve

# Metering valves

2.4

Flow control valves type SF, SD, SK, and SU

The flow control valves type SF, SD, SK and SU are available in 2 and 3-way versions. They enable continuous adjustment of the oil flow settings in oil-hydraulic systems. With the type SU, a choice can be made between two constant flows. The flow rate is kept constant within a close tolerance regardless of the system pressure and viscosity of the hydraulic oil. Additional control functions (pressure-limiting valve and idle circulation valve integrated in the valve or implemented externally via Z control port) enable adjustment to specific requirements. The 2-way flow control valves are available with bypass check valve and bridge circuit for free selection of the flow direction. The various actuation modes make these flow control valves suitable for a broad range of applications.

**Features and benefits:**

- Various actuation modes
- Also in combination with bypass check valves

**Intended applications:**

- Construction machinery
- Machine tools
- General hydraulic systems

# Metering valves

2.4

2-way flow control valves type SB, SQ and SJ

The 2-way metering valves (lowering brake valves) type SB or SQ are preferential-ly used for flow control tasks of single-acting cylinders. In doing so, the lowering speed is largely kept constant regardless of the size of the load. The integrated sliding metering orifice enables completely free flow in the opposite direction. While with type SB, there is a slight load dependence preventing the occurrence of oscilla-tions (e.g. required for fork lift trucks), type SQ has largely load-independent  $\Delta p$ -Q characteristics.

These flow control valves are preferentially used to limit control flows in pilot circuits. The DSJ version for flow limitation in both flow directions is intended for double-acting consumers.

Features and benefits:

- Oscillation damping or load-independent
- Compact screw-in valve

Intended applications:

- General hydraulic systems
- Industrial trucks
- Lifting equipment

Nomen-clature:	2-way flow control valve (drop rate braking valve)
Design:	Screw-in type with housing for in-line installation
Adjustment:	Fixed (pre-set) Tool adjustable from outside

# Metering valves

2.4

Flow control valves type SE and SEH with electro-proportional actuation

The flow control valves type SE and SEH are used for continuous adjustment of the operating speed of connected hydraulic consumers regardless of pressure. They can be used as 2-way or 3-way flow control valves and are available with proportional electrical, directly actuated (type SE) or proportional electro-hydraulic, piloted (type SEH) control orifice adjustment (each available with normal position as open or closed). They help to achieve fully automated operating cycles with individually preselected acceleration and deceleration phases.

A piloted pressure-limiting valve and an electrically switchable circulation valve (3-way controller) or a bypass check valve and check valves in a bridge circuit for free selection of the flow direction (2-way controller) can be selected as additional elements.

Features and benefits:

- Electrical control of consumer operating speeds
- Automation of operating cycles

Intended applications:

- Construction machinery
- Machine tools
- General hydraulic systems

# Metering valves

2.4

Flow dividers type TQ and TV

The flow dividers type TQ divide (collect) total flow entering (exiting) at port C. The distribution is independent of working pressure at ports A and B, and may be divided equally or unequally in predetermined portions.

Type TV flow dividers feature privilege division. A variable flow entering at port C is divided into a partial flow  $Q_A$ , which is kept constant, and a residual flow  $Q_B$ . As soon as one consumer's movement is stopped, the flow to the other is either reduced to a minimal flow (type TQ) or completely reduced to leakage flow (type TV). It is possible to overcome this design feature by simulating flow via a pressure-limiting valve. These valves are used for applications where one pump is required to supply two unevenly loaded hydraulic consumers, which must be driven simultaneously and independently (type TQ) or if one consumer simply requires a constant flow (type TV).

Features and benefits:

- Accurate flow division

Intended applications:

- Steering systems
- Synchronized cylinder movement

Nomenclature:	Flow dividers with or without priority division
Design:	Individual valve for pipe mounting Manifold mounting
Adjustment:	Non-adjustable
p <sub>max</sub> :	300 ... 350 bar

2.4

Orifices and restrictor check valves type EB, BE, and BC

The orifice inserts type EB are part of the flow valves, whereas the restrictor check valves type BE and BC are a combination of a flow and check valve. These valves are preferentially used to limit flows when switching directional valves (e.g. flow limitation to  $Q_{max}$  and avoidance of excessively rapid accumulator draining). The restrictor check valves type BC and BE are designed as a hole or slot orifice and enable free flow in the direction  $F \rightarrow B$  and throttle function in the opposite direction. Type BC is spring loaded and can be screwed into normal threaded holes (point angle  $118^\circ$ ). Type EB orifice inserts can be used in the P gallery of manifold mounting valves, for example.

- Features and benefits:**
- Max. 700 bar

# Metering valves

2.4

Throttles type Q, QR, QV, and FG

Throttles are a type of metering valve. The valve types Q, QR and QV are subdivided into five sizes and are used to limit the flow in accumulator and control circuits. They are designed as slot-type throttles (complete stroke) and are therefore impervious to micro-contaminants (no edge filter effect).

The precision throttle valves type FG are preferentially used for adjusting the switching time of directional valves, preventing pressure surges and damping oscillations. The throttle effect is achieved via the effective thread length.

The settings can only be adjusted using tools.

- Features and benefits:**
- Different installation options
  - Simple design

- Intended applications:**
- General hydraulic systems

# Metering valves

2.4

Throttles and restrictor check valves type ED, RD, and RDF

The throttles type ED, RD and RDF are metering valves and are used to influence the flow in single and double-acting consumers. The two smallest sizes are designed as a combination of a slot-type and annular gap throttle to improve adjustability. The larger sizes are pure annular gap throttles. With RD restrictor check valves, the check valve function is performed by a shim that responds to the smallest oil flow movement. With the restrictor check valves type RDF, a nozzle or orifice disc takes on the check valve function. The type ED is designed as a pure throttle.

- Features and benefits:
- Sensitively adjustable
  - Wear-resistant

2.4

Throttles and restrictor check valves type CQ, CQR, and CQV

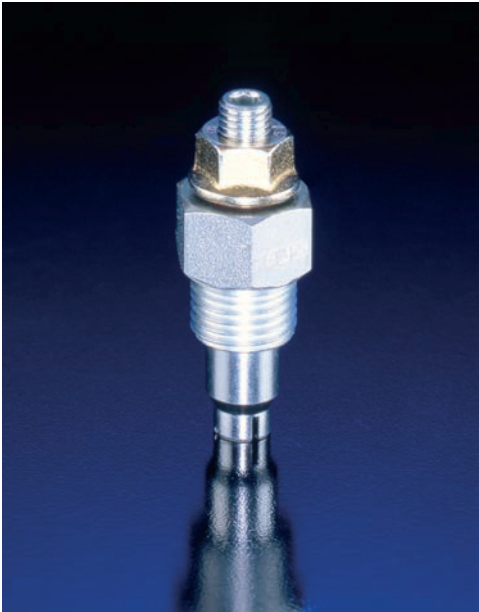

The throttles type CQ, CQR and CQV are metering valves and are used to influence the flow in single and double-acting consumers. The throttles described here are designed as slot-type throttles and are therefore impervious to micro-contaminants (no edge filter effect). The check valve function of types CQR and CQV is performed by a shim that guarantees short response times. The double spindle seal enables leakage-free adjustment, even under pressure.

**Features and benefits:**

- Leak-free adjustment under pressure
- Operating pressure up to 700 bar

**Intended applications:**

- Speed regulation in hydraulic lifting devices

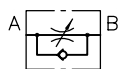

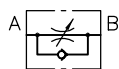

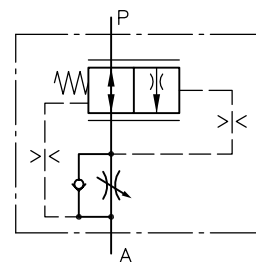

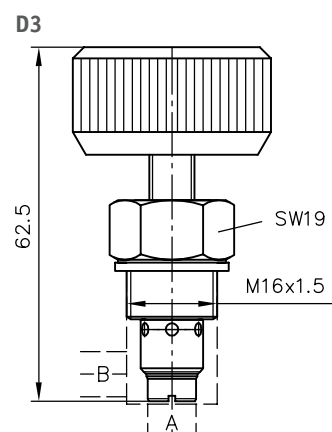

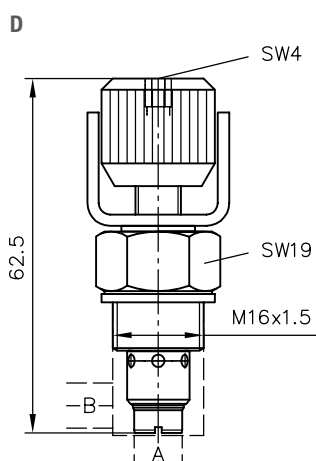

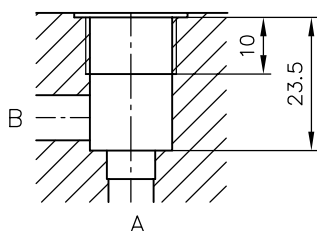

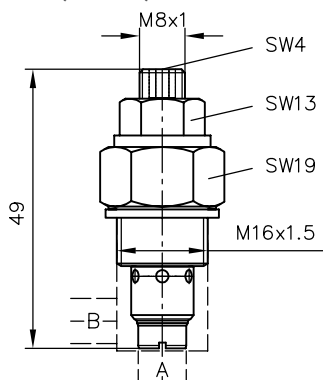

Nomenclature:	Throttle Restrictor check valves

# Metering valves

## 2.4 Throttle and shut-off valves type AV, AVT, and CAV

The throttle and shut-off valves type AVT, AV and CAV (in various sizes) are metering valves and are designed as screw-in valves in the versions AV...E and CAV. They help to generate a pressure difference between the inlet and outlet side to regulate the speed of cylinders in accumulator circuits and the flow in control circuits, or to completely shut off a consumer line (e.g. to safeguard a pressure gauge). With AV valves, the throttle effect is caused by an annular gap, which is created by a valve cone entering a valve seat hole (needle valve). CAV valves create the variably adjustable pressure difference by means of a slot (slot-type throttle, sensitively adjustable and impervious to micro-contaminants). Versions with an integrated check valve enable free flow in one direction.

**Features and benefits:**

- Various configurations
- Sensitive adjustment and complete shut off possible

**Intended applications:**

- General hydraulic systems

# Check valves

## 2.5 Check valves type RK/RB, RC, RE, and ER

Check valves type RK, RB, RC, RE and ER are used to block the flow in one direction and enable free flow in the opposite direction. RK/RB check valves are spring-loaded, sturdily designed and dirt-resistant ball seated valves.

The screw-in check valves type RC may be installed in both directions with the spring-loaded valve shim enabling rapid switching sequences. The check valve type RE is a shim-type check valve without spring pre-load. This enables a very compact and simple method of blocking the oil flow in one direction. This valve can be used as a "foot valve" in the suction pipe of pumps, for example.

The mounting hole for all screw-in check valves can be easily machined with a standard twist drill (point angle 118°).

The insert check valves type ER feature a spring-loaded, ball seated design and are primarily used in manifold-mounted versions of seated valves.

**Features and benefits:**

- Operating pressures up to 700 bar
- Easily machined mounting holes
- Sturdy

**Intended applications:**

- General hydraulic systems
- Hydraulic pre-loading

# Check valves

2.5

Screw-in check valves with hydraulic release type CRH and RHC

The screw-in check valves with hydraulic release type CRH and RHC are used in hydraulic circuits together with design related, leaking directional valves, as a hydraulically actuated drain, or idle circulation valves.

The valves type RHC with and without pre-release (for high pressures and large consumer volumes) are designed as insert valves. The mounting hole (also sealing surface) is to be machined with a standard twist drill (point angle 118°).

Different variants extend the range of applications.

The type CRH is a screw-in valve for very easily machined mounting holes.

Features and benefits:

- Cartridge valve
- Pressures up to 700 bar
- Flows up to 200 lpm
- Sturdy

Intended applications:

- Industrial hydraulics
- Construction machinery

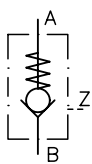

Nomenclature:	Check valve with hydraulic release

# Check valves

2.5

Check valves with hydraulic release type HRP

The check valves type HR with hydraulic release, are designed as manifold mounting valves and are available in six sizes. These valves are used in hydraulic circuits with design related, leaking directional valves, as hydraulically actuated drain, or idle circulation valves. The check valve type HRP can be ordered also with a pre-release to suppress decompression surges for circuits with high pressure and high consumer flows.

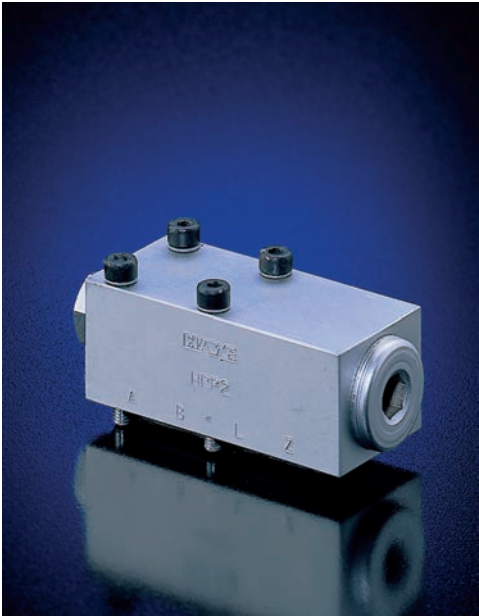

This valve is extremely tolerant to residual pressure in the return duct (port B), as the rear side of the actuation piston is de-pressurised via a drain port. Another option allows opening of the check valve via the load pressure on the consumer side, controlled by a flange-mounted solenoid valve.

Features and benefits:

- Manifold mounting valve for max. pressure 700 bar
- Flows up to 400 lpm
- Electrically controlled
- With pre-release for smooth switching

Intended applications:

- Industrial and mobile hydraulics

Nomen-clature:	Check valve with hydraulic release
Design:	Manifold mounting valve
Actuation:	Hydraulic Electro-hydraulic

# Check valves

2.5

Check valves with release type RH and DRH

Check valves with hydraulic release are used to block one or both hydraulic consumer pipes or as a hydraulically actuated drain or circulation valve. The valves type RH and DRH are also available with pre-release for one or both sides of the connection to suppress decompression surges for circuits with high pressures and high consumer flows.

Features and benefits:

- Pressures up to 700 bar
- With pre-release for smooth switching

Intended applications:

- Blocking of leak-free hydraulic cylinders in connection with a directional spool valve control suffering from leaking oil
- Return flow relief if return oil flows that are greater than the permissible flow for the directional valve are experienced due to the surface ratio, when introducing a double-acting hydraulic cylinder
- Hydraulically actuated drain or circulation valve

# Check valves

2.5

Check valves and pre-fill valves type F

Check valves and pre-fill valves type F are check valves. They are designed as spring-loaded disc seat valves. The check valves type F enable free flow in one direction and block flow in the opposite direction.

As a pre-fill valve (check valve with hydraulic release), they are used for example in top ram presses for draining and replenishing press cylinders during opening and closing in rapid traverse mode.

The smaller sizes may be optionally equipped with a pre-release device (decompression at high pressures via the valve) to prevent decompression surges.

Features and benefits:

- Wafer design
- Extremely large flows, up to 7000 lpm

Intended applications:

- Press control systems
- Injection moulding machines

Nomenclature:	Check valve Check valve with hydraulic release (pre-fill valve)
Design:	Intermediate section between pipe flanges

# Check valves

2.5

Line rupture safety valves type LB

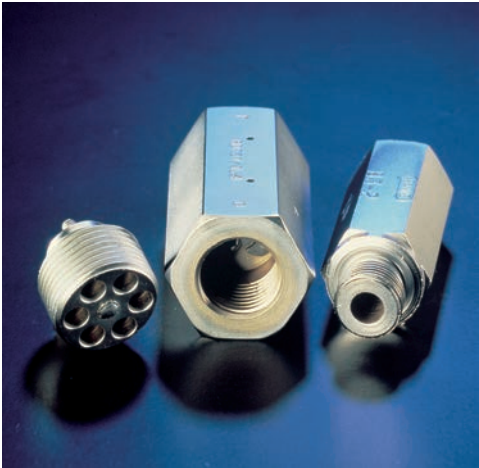

The line rupture safety valves type LB are check valves. They are available as insert valves or with housing for pipe connection.

The line rupture safety valve, which is generally mounted directly on the consumer (cylinder) serves to block a consumer in the event of a break in a pressurised pipe, i.e. if the hydraulic counter pressure subsides. It therefore prevents an uncontrolled decline in the load. A flow in excess of the setpoint results in a shim that has been lifted off the valve seat with spring force being pressed onto the housing seat by the flow forces, and consequently the valve closes.

Two versions – one for completely stopping the load and one with an orifice hole for a slow decrease – enable this valve to be used for various requirements.

- Features and benefits:**
- Pressures up to 700 bar

- Intended applications:**
- Industrial trucks
  - Lifting devices

Nomenclature:	Line rupture safety valve
Design:	Valve insert with housing for in-line installation
Adjustment:	Tool adjustable

2.5

Shuttle valves type WV and WVC

Shuttle valves are stop valves with two inlets and one outlet. There is a ball in the inside of the valve, which can travel from one inlet to the other. It will automatically block the one inlet with the lower pressure. This way the higher inlet pressure is automatically led to the outlet port.

The version for pipe connection is incorporated in a T-fitting. The WVC version is designed as an insert valve.

**Features and benefits:**

- Max. pressure 700 bar
- Insert and housing versions

**Intended applications:**

- For Load-Sensing systems
- Often in mobile hydraulics

Nomenclature:	Shuttle valve

3

Hydraulic clamps type HSE and HSA

Hydraulic clamps type HSE and HSA are single-acting power elements equipped with return springs, which are used in hydraulic fixtures where only a very restricted space is available for the generation of high forces with limited piston movement. The type HSE is designed as a screw-in cylinder whereas type HSA is manifold mounting. These clamps are available, depending on application with piston diameters between 12 and 40 mm and strokes between 2 and 25 mm. They are mainly used for clamping work pieces, slides and guides, indexing round tables and for bending punching and cutting purposes.

**Features and benefits**

- Compact
- Operating pressure up to 500 bar

**Intended applications:**

- Clamping systems
- Securing systems

Pressure switches type DG

Pressure switches close or open electrical contacts when under pressure. They are used to issue an electrical switching command or signal for further operations when a predefined pressure value is reached.

Different versions (with pressure setting on an adjusting knob, main and secondary switch, screw-on pressure switch) enable their use in a wide range of applications. A design-related difference (hysteresis) of 8... 20% is to be expected between the upper and lower switching point in piston-type pressure switches.

In contrast to this, the type DG5E and DG6 electronic pressure switches provide the option to select two independent pressure switching points and/or program or adjust the hysteresis.

Type DT is an analogous pressure sensor.

Features and benefits:

- Compact design
- Option of integration into the HAWE modular system
- Operating pressures up to 1000 bar

Intended applications:

- General hydraulic systems
- Machine tools

Hydraulic miniature accumulators type AC

The hydraulic accumulators type AC are available in two categories. The hydraulic miniature accumulators with a capacity of 0.013 dm<sup>3</sup> and 0.040 dm<sup>3</sup> are used for applications including clamping hydraulics for volume compensation in the event of temperature fluctuations, covering possible oil losses due to leakage or oscillation damping of functional parts activated by pressure difference.

The diaphragm accumulators with a capacity of up to 3.5 dm<sup>3</sup> are primarily used as a source of pressure oil for supporting/increasing the pump delivery flow and storing pressure energy, in order to achieve an accumulator charging circuit, for example. Various fittings enable the integration of a hydraulic system in different installation positions and at different installation points.

- Features and benefits:**
- Compact design
  - Option of integration into the HAWE modular system
  - Operating pressures up to 500 bar
- Intended applications:**
- Clamping systems
  - Jigs
  - Accumulator charging systems

4
Piston type accumulator type HPS

In many mobile and stationary applications, a modern hydraulic system includes reliable and powerful hydraulic accumulators. They are especially useful when energy is to be stored, pressure surges are to be damped, leakage is to be compensated or high flows are to be delivered in a short time. There is usually no faster or easier solution to do so than with a piston-type accumulator. The freely moving piston separates the compressible gas cushion and the hydraulic fluid. High-quality and thoroughly tested piston sealings guarantee a reliable separation of gas and oil even under extreme conditions.

To enable any arrangement of the piston-type accumulator, the accumulators are available with the appropriate mounting clips.

- Features and benefits:**
- Compact design
  - Option of integration into the HAWE modular system

- Intended applications:**
- Accumulator charging systems
  - Construction machinery
  - Wind turbine systems

Hydraulic accessories

Hydraulic systems use measuring instruments ( ) for pressure monitoring, command devices for pressure-controlled switching (pressure switches) and hydraulic accumulators. Using the various fittings, these devices can be connected to the pressure pipes of HAWE hydraulic power packs as well as valves in a wide range of installation situations.

help to combine devices. Other accessories, such as screen and wire mesh filters protect hydraulic devices from larger, stray impurities that occasionally occur. These are available in two versions: as screen filters and wire mesh filters (wire mesh filters preferentially used in control circuits without a significant current flow).

Features and benefits:

- Compact design
- Option of integration into the HAWE modular system
- Operating pressures up to 700 bar

Intended applications:

- General hydraulic systems

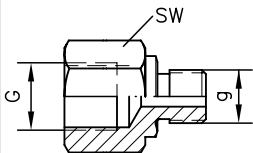

Nomenclature:	Reducing connector Connection fitting Screen filter Wire mesh filter Pressure gauge

5

Electronic accessory components

A range of electronic accessory components is available in various versions for the control of common on/off and proportional solenoids. These include electronic amplifiers in the form of modules and cards and versions integrated in the plug for single and twin solenoids, as well as for pressure switches. A power supply unit for 24V DC solenoid valves is also available. All of these components are tailored to HAWE solenoid valves.

Features and benefits:

- Compact design
- Functions tailored to HAWE products

Intended applications:

- For control of all types of proportional valves
- Plug for visual operation control, prolonging the service life of the solenoid etc.

Nomenclature:	<ul style="list-style-type: none"><li>■ Plugs with no special feature (standard) With rectifier circuit With clamp diode With LED with economy circuit</li><li>■ Amplifier units for proportional solenoids</li><li>■ Power supply units</li></ul>
Design:	Plugs Modules with screw terminals Cards with terminal strip

Designs

Plug for solenoid valves (single and twin solenoid)

Brief description	Application
No special feature (standard)	For all applications with no special requirements
Version with LED	Visual operation control and EMC protection (note prolonged cut-off times)
Version with clamp diode	For optimum EMC protection (note prolonged cut-off times)
Version with economy circuit	Increased functional security and prolonged service life of the solenoids by reducing the voltage (pulse width modulation) after a defined period. Recommended for use in areas with high ambient temperatures and/or for application where the solenoids are permanently energised (e.g. safety circuits)
Version with rectifier circuit	Enables use of DC solenoids when a power supply of 110V AC, 230V AC is available

Plugs with no special feature (DC voltage supply) or the version with rectifier circuit for power supply of 110V AC, 230V AC are included as standard in the scope of delivery of the solenoid valve.

## Proportional amplifier

### Features:

- Constant current control (regardless of the power supply and changes in resistance of the solenoid due to heating effects)
- Improved EMC properties
- Use in a broad temperature range

### Adjustable parameters:

- $I_{\max}$  and  $I_{\min}$  setting
- Setting for ramp time up to 10 sec
- Reference voltage for potentiometric setpoint generator available
- Option to set dither amplitude and frequency

Type	Brief description	Application
EV 1 M EV 1 G EV 1 D	Module version (board only or built-in housing)	Suitable for installation in switch cabinets, secured with screw terminals
EV 22 K	Card version	Card suitable for control of two proportional solenoids. Use in card holder for one, or in a module rack for max. 3 amplifier cards

## Power supply units for solenoid valves

Type	Brief description	Application
MNG	Power supply unit for input voltage 230V AC and output voltage 24V DC, max. power rating 5A	Power supply for solenoid-actuated hydraulic valves or electrical amplifiers for proportional solenoids

## 5 Type PLVC programmable logic valve control

The type PLVC programmable logic valve control is intended for the actuation of complex hydraulic systems. Any movement sequences with pressure, speed and acceleration profiles can be implemented and saved in pre-defined limit areas. Analogue and digital components as well as components linked to CAN bus (e.g. valves, pressure sensors, joystick) can be used via cable or remotely to control tasks. This type of control can also be described as PLC with integrated prop. amplifiers.

### High flexibility via:

- Modular systems with extension and enhancement modules (Basic and expansion module)
- Flexible programming
- Different interfaces (RS 232, CAN bus, Profibus)
- All output parameters can be customised
- Software function modules (PLC programs)

### Intended applications:

- Construction machinery
- Crane systems
- Complex lifting devices
- Machines for forestry purposes
- Machine tools and press construction

**Nomenclature:** Programmable logic valve control

**Version:** Modular concept with

- Basic modules
- Expansion modules
- CAN bus nodes
- Display
- Software

### Basic types and general parameters

	PLVC 41	PLVC 21	PLVC 8	CAN-IO 14
Number of inputs <sup>1)</sup>				
Digital	27 (3 / 24)	13 (5 / 8)	17 (10 / 7)	1
Analogue	28 (4 / 24)	12 (4 / 8)	23 (11 / 12)	6 (10)
Frequency	3 (3 / -)	3 (3 / -)	3 (3 / -)	-
Emergency stop	x	x	x	-
Number of outputs <sup>1)</sup>				
Digital	16 (- / 16)	16 (8 / 8)	13 (- / 13)	4
Analogue (PWM)	16 (4 / 16)	4 (4 / -)	16 (16 / -)	4
Analogue (0 ... 10V)	1 (1/-)	--	--	-
Relay	8 (3 / 8)	4 (- / 4)	--	-
Auxiliary voltage	1 (5V DC)	--	--	-
Interfaces				
RS 232	x	x	x	x
CAN bus	x	x (- / x)	x (x / x)	x
Profibus	--	x	--	-
Voltage supply (10 ... 30V DC)	5A (10A)	5A	5A	10A

1) Always max. number of inputs and outputs, figures in brackets apply to basic modules and expansion modules

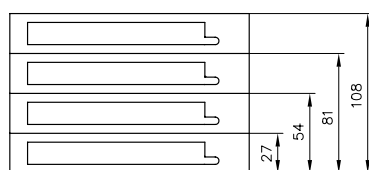

### Software function packs (examples):

- Position measurement
- CAN bus communication
- Position and volumetric flow control
- Fault detection
- Controller for closed control circuits
- Ganging
- Electronic volumetric flow distribution
- Stability
- Limit load control
- Pressure control

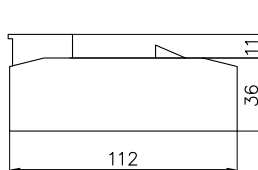

Furthermore, the system allows customers to use the aforementioned PLC programming to very quickly make individual adaptations using structured texts (ST).

Adresses of Offices and Representatives	302
Pamphlet index	310
Type index	314
Index	320

## 6 Pressure fluids – notes for selection

The performance of a hydraulic system depends to a large extent on the quality of the pressure fluid used.

The pressure fluid should essentially be selected according to the operating conditions, such as

- Temperature (see viscosity classes)
- Device type (possible ban on certain pressure fluids due to undesired reactions with metals, seals etc.)
- Usage type (e.g. environmentally compatible pressure fluids)
- Surroundings (use of existing pressure fluids)

	The following viscosity ranges and temperature ranges apply to HAWE devices:
<b>Temperature range:</b>	Surrounding area: approx. -40...+80 °C (attention: +5...+80 °C for type LP air-driven pumps) Pressure fluid: -25...+80 °C Please observe viscosity range and any additional restrictions.
<b>Permissible temperature during start:</b>	down to -40 °C (observe start-viscosity!), as long as the steady-state temperature is at least 20K higher for subsequent operation. Biologically degradable or fire inhibiting pressure fluids generally not over max. +60...+70 °C.
<b>Viscosity range:</b>	min. approx. 4 mm <sup>2</sup> /s, max. approx. 1500 mm <sup>2</sup> /s optimum service approx. 10...500 mm <sup>2</sup> /s

### Mineral oils

Pressure fluid	Characteristics	Unusual features / restrictions
■ Pressure fluids HLP (DIN 51524 part 2)	Mineral oil with additives improving corrosion, oxidation and wear protection	Common hydraulic oil
■ Pressure fluids HL (DIN 51524 part 1)	Mineral oil without wear protecting additives	No wear protection additives therefore not suitable for gear pumps. HAWE-pumps type: Z, RZ, MP..-Z, HK..Z Observe manufacturer's specifications for other devices!
■ Pressure fluids HVL (DIN 51524 part 3)	Mineral oil with same additives as HLP, but with increased viscosity index for use in higher temperature ranges	Additives improving the viscosity index show drawbacks concerning e.g. shear strength (viscosity drop during load by 30%), fall out of water and air. Use only, if temperature range requires this. Observe fluid manufacturer's specification !
■ Undoped oil H e.g. - lubricating oils (DIN 51517 part 1) - white oil (e.g. USDA H1)	Mineral oil without additives	Only for systems for intermittent service (S2 or S3 operation), due to the missing additives (low lubricating characteristic). White oil is mainly used in systems for food processing.
■ Special fluids for aviation (MIL H-5606) for off-shore applications (NATO H 540)	Mineral oils are based as a rule on naphthenic based oil with wide temperature range	Seals made of fluor rubber FPM might be required, depending on pressure fluid. Consult the oil manufacturer!
■ Other mineral oils Engine oils type HD (e.g. DIN 51511) Automatic transmission fluid type ATF(AQA Suffix A) Diesel fuel Test oil for diesel injection pumps	Mineral oils which basically were developed for other application purposes.	More or less well suited pressure fluids. Observe whether it contains additives preventing corrosion and oxidation as well as material compatibility (especially with seals). Attention: increased leakage with directional spool valves. Consult the oil manufacturer!

## Ecologically compatible pressure fluids VDMA 24568 and 24569

Pressure fluid	Characteristics	Unusual features / restrictions
■ Seed oil type HETG	Fluids based on seed oils e.g. rape or sunflower with additives show only low temperature strength (< 60...70°C)	Not suited for oil immersed hydraulic power packs type HC, MP, FP, HK, all valves with wet armature solenoids as well as control systems utilizing many throttles. Fluids type HETG show a tendency to gum, aging, and sticking at higher temperature (> 60...70°C). Their use should be avoided !
■ Polyethyleneglycol HEPG PEG-Polyethylene (may be solved in water) PPG-Polypropylene (can't be solved in water)	Fluids based on Polyethyleneglycol (PAG) Similar qualities i.e. service life, lubricating characteristics and pressure resistance, like mineral oil	No restrictions with regard to the operation behavior, but it <ul style="list-style-type: none"> <li>■ Is harmful to standard enamel (does not apply to two-pot enamel)</li> <li>■ Will clog cellulose filters (use only glass fiber or metallic filters)!</li> <li>■ Shows bad lubrication characteristic with material pairings steel / light alloy or brass</li> <li>■ Is not suitable for pumps type HC, MP, FP, HK, RZ, Z and connection blocks with filter type A.F., AF, BF, EF, FF</li> </ul>
■ Synthetical ester HEES (carbon acid ester, diester, polyester)	Similar qualities i.e. service life, lubricating characteristics and pressure resistance, like mineral oil	No restrictions with regard to the operation behavior. Contact with PVC should be avoided.

## Fire inhibiting pressure fluids conforming DIN 51502

Pressure fluid	Characteristics	Unusual features / restrictions
■ HFA (pressurized water, emulsions)	Emulsion, oil solved in water (water content > 80%) max. temp. range approx. 60°C	There is the danger of corrosion and cavitation due to the high water content, therefore only devices intended for it, should be used (some pump versions of type R, directional seated valves acc. to D 7300). Max. oper. pressure of the pump 50...60% (danger of cavitation) Min. oil content > 4% <ul style="list-style-type: none"> <li>■ No use of oil immersed hydraulic power packs – danger of short-cuts-applies to pumps type HC, MP, FP, HK</li> <li>■ No cellulose filters – danger of clogging</li> </ul>
■ HFC	Glycol / water solution (water content < 35%) max. temp. range approx. 60°C	No restrictions with regard to the operation behavior, but it <ul style="list-style-type: none"> <li>■ Is harmful to standard enamel (does not apply to two-pot enamel)</li> <li>■ Will clog cellulose filters (use only glass fiber or metallic filters)!</li> <li>■ Shows bad lubrication characteristic with material pairings steel/light alloy or brass</li> <li>■ Is not suitable for pumps type HC, MP, FP, HK, RZ, Z and connection blocks with filter type A.F., AF, BF, EF, FF</li> </ul>
■ HFD HFDR phosphoric ester HFDS chlorinated hydrocarbon HFDT blend of HFDR and HFDS HFDU other composition	Fluids without water content, similar qualities like mineral oil	No restrictions with regard to the operation behavior, but it <ul style="list-style-type: none"> <li>■ Requires seals out of FPM (FKM) (see also section "Seals")</li> </ul>

## Special fluids

Pressure fluid	Characteristics	Unusual features / restrictions
<ul style="list-style-type: none"> <li>AT-Brake fluid</li> </ul>	Brake fluid based on glycol (DOT 4)	No restrictions with regard to the operation behavior, but devices must be equipped with EPDM or SBR-seals when operated with brake fluid (see also section "Seals") No compact hydraulic power packs type HC, MP, FP, HK

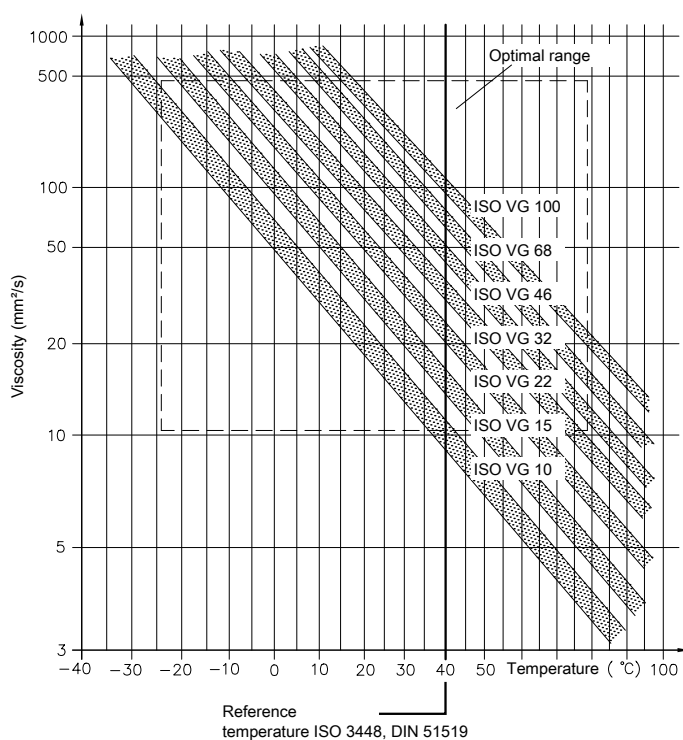

## Selection of the viscosity

The industrial standard "ISO Viscosity classification for liquid lubricants" (ISO 3448, DIN 51519) lists 18 viscosity classes, but only the viscosity classes ISO VG10 to ISO VG68 are of common interest for hydraulic systems. The index No. behind ISO VG informs about the nom. viscosity at 40°C. The temperature behavior illustrated in the curve applies to mineral oil only. The behavior of HVLP and environmentally friendly fluids is less temperature dependent i.e. the curve is less steep.

Due to manufacturer-related differences, the following benchmark figures are to be clarified and compared with the permissible viscosity ranges:

- Viscosity at 40°C
- Viscosity at the lowest (estimated or demanded) temperature
- Viscosity at the highest (estimated or demanded) temperature (to ensure sufficient service life of the seals not above 80°C!)

## Temperature / viscosity curve

## Guide lines for selection

- VG10, VG15**  
 Systems intended for short time operation or use in the open or for clamping devices.  
 Systems intended for continuous operation (for use in the open, operation in winter only)
- VG22, VG32**  
 General application (for use in the open, operation in summer only)
- VG46, VG68**  
 Systems in tropical conditions at ambient temperatures up to 40°C or closed rooms

## Filtration

Major malfunctions of a hydraulic system can be caused by contamination like fine wear particles and dust or bigger particles e.g. swarf, rubber from tubing or seals. Therefore the following filtration is recommended (after a thorough initial flushing):

Recommended purity of the pressure fluid			Recommended filter fineness	Devices	
ISO 4406 : 1999	NAS 1638	SAE T 490			
21/18/15...19/17/13	12 ... 8	≥6	$\beta_{16...25} \geq 75$	Radial piston and gear pumps, valves, cylinders (use in general mechanical engineering)	The purity degree of the pressure fluid is especially important for the repeatability accuracy with proportional valves. It should be noted that new pressure fluid "from the barrel" does not necessarily fulfil the highest cleanliness requirements.
20/17/14...18/15/12	11 ... 6	5 ... 3	$\beta_{6...16} \geq 75$	Prop. pressure and flow control valves	

Lower limits must be applied for pressure above 250 bar

## Service life

The aging of pressure fluids is caused by shearing processes, cracking induced by high temperatures (gumming), mixing with (condensed) water or reaction with other materials (e.g. metal) in the system (sludging). A major factor for the service life of the fluid is beside the anti-shear additives of the fluid the lay-out of the system e.g. tank size, operation temperature, number and design of throttling sections. Besides the properties of the pressure fluid itself (e.g. due to additives for high shear stability), the design of the hydraulic control system (e.g. tank size, steady-state temperature, number and type of throttling points) has a major influence on this.

The following points are to be noted:

- Service temperature in the tank < 80°C  
(mineral oils, pressure fluids with low water content) Avoid higher temperatures – Service life reduction – (+10K corresponds to half service life)
- Circulation ratio of the pressure fluid  $\frac{Q_{pump}[l/min]}{V_{circuit}[l]}$  (guideline)
  - approx. 0.2...0.4/min for conventional hydraulic power packs
  - approx. ...1/min for mobile hydraulics
  - approx. ...4/min for hydraulic power packs operated on/off or with idle circulation
- Control of the pressure fluid on a regular base (fluid level, contamination, coloring index, neutralization value etc.)
- Change of the pressure fluid on a regular base (depending on fluid type and application conditions)  
Guideline:
  - approx. 4000 ... 8000 h (mineral oil)
  - approx. 2000 h (other pressure fluids)
  - or at least annually
 Take into account notes of the fluid manufacturer!

## Change of the pressure fluid

Mixing different kinds of pressure fluid sometimes can cause unintended chemical reactions such as sludging, gumming etc.

Therefore the relevant manufacturers should be consulted when switching between different pressure fluids.

In all cases, the whole hydraulic system must be rinsed thoroughly.

## Seals

Any question about the compatibility with seal material should be settled with the fluid manufacturer always before using a certain pressure fluid (except mineral oil and synthetic esters). A rough overview is given in the table at the start of this section. HAWE utilizes seals made of the following materials as standard:

- NBR (acrylonitrile rubber, e.g. Bunan, Perbunan) or HNBR (hydrated NBR).

Some devices are available on request with seals made of:

- FPM (also FKM, fluor rubber) e.g. for fluids type HFD
  - The coding ...-PYD should be added to the coding for HAWE devices, e.g. WN1H-G24-PYD
- EPDM (ethylen propylen rubber) or SBR (styrene-butadiene rubber)
  - The coding ...-AT should be added to the coding for HAWE devices, e.g. WN1H-G24-AT (for brake fluid)

### Storage of hydraulic components

The storage conditions for hydraulic components depend primarily on the seals used and the test bench oil with which the parts are moistened. The storability of rubber materials is generally influenced by the following factors:

- Warmth, light, humidity, oxygen, ozone

The storing conditions for hydraulic components mainly depend on the used seal material and the test rig fluid which is on all internal parts. The storability of rubber materials is generally influenced by the following factors:

Ozone-producing equipment (electric motors, high-voltage equipment) among other things must not be present in the storage room.

If seals are packaged in plastic bags, these should not contain any plasticisers and, if necessary, should be impermeable to UV light.

Details on storage of elastomers are also available in the following standards: DIN 7716/BS3F68:1977, MIL-HDBK-695C, MIL-STD- 1523A, DIN 9088.

Hydraulic oils can be stored for an unlimited period in sealed containers supplied by the manufacturer, as no chemical reactions take place. The presence of atmospheric oxygen, dust and moisture can lead to more or less rapid oxidation and resinification, depending on the type of oil and its additives.

A dark room with virtually constant temperature and humidity is recommended for storage of hydraulic components. The parts should be kept in a plastic bag to protect them from dust and continuous air exchange. In addition, a functional test (emergency manual override, dry switching) should be carried out on the device at least once a year to ensure operation when required.

With safety-related components, a six-monthly functional test on site and a regular factory inspection including seal replacement every 2 years are recommended.

The risk of corrosion of hydraulic components that are stored as described above is low, as most external parts are coated with a protective layer (galvanised, gas-nitrated) and moistened with oil.

## 6 Devices for special applications

The complexity of the selection of the proper pump, valves and other components is increasing as the number of products available is rising and as the devices are getting more specialized. We have listed the devices on the following pages according to their function or their intended purpose. This selection should be used only as a rough guide for general applications and do not include all HAWE products available. A brief description for most of these products may be found in the main sections of this product catalogue. More detailed information is contained in the corresponding supplemental pamphlets listed, which may be ordered via our sales offices, representatives or directly from HAWE in Germany.

### Devices intended for the following applications:

- Hydraulics for clamping
- Press control systems
- Industrial trucks
- Mobile hydraulics
- Systems for potentially explosive atmospheres, ATEX-compliant
- Use with HFA, emulsions or press water

### Devices with the following characteristics:

- Proportional valves
- Devices for system pressure from 500 to 700 bar
- Cartridge and screw-in valves
- Devices with unit approval or special listing (TÜV, GL, automotive industry)
- (TÜV, GL, automotive sector)

### Devices for clamping at machine toll, jigs etc.

Nomenclature	Q <sub>max</sub> [lpm]	p <sub>max</sub> [bar]	Pamphlet	Page

Pressure sensor type DT11 and DT2		500	D 5440 T/1, D 5440 T/2	<a href="#">266</a>
Hydraulic miniature accumulators type AC		330	D 7571	<a href="#">268</a>
Hydraulic miniature accumulators type AC			D 7969	<a href="#">268</a>
Fittings type X 84			D 7077	<a href="#">272</a>
Device connectors with LED and clamp diode etc. type MSD, SVS, MSE and MSUD			D 7163	<a href="#">276</a>
Economy circuit type MSD4 P53 and MSD4 P63 for solenoid valves with actuation solenoids type WG 230/115, 50/60 Hz			D 7813	<a href="#">276</a>
Economy circuit type MSE 28026			D 7832	<a href="#">276</a>
Economy circuit type MSD 4 P55 for solenoid valves with actuation solenoids type G 24 V DC			D 7833	<a href="#">276</a>
Mains supply type MNG			D 7835	<a href="#">276</a>
Programmable logical valve control type PLVC			D 7845-2, D 7845-4, D 7845 HMI, D 7845 M	<a href="#">278</a>
CAN node type CAN-IO 14			D 7845 IO	<a href="#">278</a>

## Hydraulics for clamping especially for chucks of lathes or other consumers with design related leakage

Nomenclature	Q <sub>max</sub> [lpm]	p <sub>max</sub> [bar]	Pamphlet	Page
Compact hydraulic power packs type HK, HKF and HKL	12.9/16	700/150	D 7600-4, D 7600-3, D 7600-3L, D 7600-2	<a href="#">26</a>
Connection blocks some with reflow or pressurized filter type A		700	D 6905 A/1	<a href="#">32</a>
Valve banks type BA	25	500	D 7788	<a href="#">34</a>
Intermediate plates NG 6, type NZP	20	400	D 7788 Z	<a href="#">34</a>
Solenoid actuated directional spool valve type SWP and NSWP	25	315	D 7450, D 7451, D 7451 N	<a href="#">84</a>
Clamping modules type NSMD	25	100	D 7787	<a href="#">116</a>
2/2- , 3/2- and 4/3-way directional seated valves type NBVP	20	400	D 7765 N	<a href="#">156</a>

## Press controls (top or bottom acting ram presses, or presses for laboratories, injection molds)

Nomenclature	Q <sub>max</sub> [lpm]	p <sub>max</sub> [bar]	Pamphlet	Page
Two stage connection block type NA		700/120	D 6905 A/1	<a href="#">32</a>
Pumps complete with motor and hydraulic power packs type MP, MPW, and MPN	14.8/108	700/150	D 7200, D 7200 H, D 7207	<a href="#">22</a>
Hydraulic pumps type R and RG	91.2	700	D 6010, D 6010 H, D 6010 D, D 6010 DB, D 6010 S	<a href="#">46</a>
InLine variable displacement axial piston pump type V30D and V30E	365	350 (420)	D 7960, D 7960 E	<a href="#">50</a>
Hydraulic pumps type RZ	91.2/135	700/150	D 6910, D 6910 H	<a href="#">62</a>
Air driven hydraulic pumps type LP	12	1500	D 7280, D 7280 H	<a href="#">68</a>
Hand pumps type H, HD, HE, and DH		600	D 7147/1	<a href="#">74</a>
Directional seated valves with different actuations type G, WG, H, P, K, T, F and D	120	700	D 7300, D 7300 Ex, D 7300 H	<a href="#">124</a>
Directional seated valves with different actuations type of NG, NWG, NH, NP, NK, NT, NF and ND (connection hole pattern NG 6)	12	500	D 7300 N	<a href="#">124</a>
Valve banks type VB	120	700	D 7302	<a href="#">130</a>
Lift monitored seated valves	120	400	D 7300 H	<a href="#">124</a>
Switch units type CR	20/160	500/60	D 7150	<a href="#">164</a>
Directly controlled pressure valves type MV, MVS, MVE, MVP, SV, SVC, MVCS, DMV and DMVN, ssembly kits type MVE, MVH etc., multiple pressure limiting valves	160	700	D 7000/1, D 7000 E/1, D 7000 M, D 7000 TÜV	<a href="#">178</a>
Piloted pressure valve type DV, DVE, and DF	120	420	D 4350	<a href="#">184</a>
Piloted pressure valve with check valve type AL, AE, and AS	120	350	D 6170	<a href="#">184</a>
Prop. pressure limiting valve type PMV	120	700	D 7485/1	<a href="#">188</a>
Prop. pressure valves type PDV	120	350	D 7486	<a href="#">188</a>
Shut-off valve type LV	25	350	D 7529	<a href="#">208</a>
Idle circulation valves type CNE, for mounting in simple, tapped holes	30	450	D 7710 NE	<a href="#">204</a>
Pressure reducing valve with tracked pressure switch type DK	15	400	D 7941	<a href="#">196</a>
Two stage valves type NE	25/180	700/60	D 7161	<a href="#">206</a>
Slot type throttle type CQ, CQR, and CQV, for mounting in simple, tapped holes	50	50	D 7713	<a href="#">236</a>
Blocking valves with pre-release type RHV	200	500	D 3056	<a href="#">248</a>
Check valves and pre-fill valves type F	4000	400	D 6960	<a href="#">254</a>
Electro-hydraulic pressure switches type DG		800	D 5440, D 5440 E/1, D 5440 F	<a href="#">266</a>

Nomenclature	Q <sub>max</sub> [lpm]	p <sub>max</sub> [bar]	Pamphlet	Page
Hydraulic miniature accumulators type AC		330	D 7969	<a href="#">268</a>

#### Devices for industrial trucks and lifting equipment (e.g. stackers, lifting platforms etc.)

Nomenclature	Q <sub>max</sub> [lpm]	p <sub>max</sub> [bar]	Pamphlet	Page
Solenoid actuated directional spool valve type SW, SWR, SWP and SWS	25	315	D 7450, D 7451, D 7951	<a href="#">84</a>
Directional spool valves type DL	90	315	D 7260	<a href="#">98</a>
Proportional directional valves type HMPL and HMPV	160	420	D 7700 H	<a href="#">104</a>
2/2-way directional seated valves type EM and EMP	160	450	D 7490/1	<a href="#">152</a>
Lifting/lowering valves type HSV and HZV	120	315	D 7032	<a href="#">162</a>
Lifting modules type HMB, HMC, and HST	90	315	D 7650, Sk 7650 B2, Sk 7650 B33, Sk 7650 HST	<a href="#">166</a>
Lifting modules type HMT, HSN, HMS, HMF, HMR and HSW	90/100	315	Sk 7758 HMT etc.	<a href="#">166</a>
Directly controlled pressure valves type MV, MVS, SV, SVC, MVCS, DMV and DMVN, assembly kits type MVF, MVH etc., multiple pressure limiting valves	160	700	D 7000/1, D 7000 E/1, D 7000 M	<a href="#">178</a>
Pre-loaded check valves type VR	120	300/15	D 7340	<a href="#">186</a>
Load-holding valves type LHK and LHT	250	400	D 7100, D 7918	<a href="#">212</a>
2-way flow control valves (drop-rate braking valves) type SB	400	315	D 6920	<a href="#">222</a>
2-way flow control valves type DSJ	25	315	D 7825	<a href="#">222</a>
Emergency drain valve type BR		400	D 7854	
Line rupture safety valves type LB	160	500	D 6990	<a href="#">256</a>
Prop. amplifiers type EV22K			D 7817, D 7817/1	<a href="#">276</a>
Prop. amplifiers type EV1M			D 7831/1	<a href="#">276</a>
Prop. amplifiers type EV1D			D 7831 D	<a href="#">276</a>
Prop. amplifiers type EV1G			D 7837	<a href="#">276</a>
Programmable logical valve control type PLVC			D 7845-2, D 7845-4, D 7845 HMI, D 7845 M	<a href="#">278</a>
CAN node type CAN-IO 14			D 7845 IO	<a href="#">278</a>

#### Devices for mobile applications (e.g. crane controls, ship building)

Nomenclature	Q <sub>max</sub> [lpm]	p <sub>max</sub> [bar]	Pamphlet	Page
InLine variable displacement axial piston pump type V30D and V30E	365	350/420	D 7960, D 7960 E	<a href="#">50</a>
InLine variable displacement axial piston pump type V60N	240	350/420	D 7960 N	<a href="#">54</a>
Variable displacement axial piston pumps type V40M	65	250/320	D 7961	<a href="#">58</a>
Air driven hydraulic pumps type LP	12	1500	D 7280, D 7280 H	<a href="#">68</a>
Hand pumps type H, HD, HE and DH		600	D 7147/1	<a href="#">74</a>
Individual directional spool valves type SG and SP	100	400	D 5650/1	<a href="#">80</a>
Directional spool valves type DL and DLS	90	315	D 7260	<a href="#">98</a>
Prop. directional spool valves type PSL and PSV (valve bank via directly attached valve sections)	210	420	D 7700-2, D 7700-3, D 7700-5	<a href="#">104</a>
Prop. directional spool valves type PSLF and PSVF (valve bank via manifold mounting valve sections)	500	420	D 7700-F	<a href="#">110</a>
Directly controlled pressure valves type MV, MVS, MVE, MVP, SV, SVC, MVCS, DMV and DMVN, assembly kits type MVF, MVH etc., multiple pressure limiting valves	160	700	D 7000/1, D 7000 E/1, D 7000 M	<a href="#">178</a>

## Devices utilized by the automotive industry

		Chapter
BMW	Hydraulic power packs (tank < 40 l)	1.1, 1.2, 1.3, 1.4
	Radial piston pumps	1.2, 1.3
	Seated valves	2.2
MERCEDES-BENZ	Hydraulic power packs for high pressure	1.1, 1.2, 1.3, 1.4, 1.5
	Seated valves (NG 6)	2.2
	Check valves with release (type RH, DRH)	2.5
	Clamps (type HSA, HSE)	3
	Hydraulic power packs < 63 l-tank (type HC, MP, HK) Hydraulic power packs	1.1, 1.2
FIAT	Hydraulic power packs	1.1, 1.2, 1.3, 1.4
	Radial piston pumps	1.2, 1.3
OPEL	Valves for pipe connection	2.1, 2.2, 2.3, 2.4, 2.5
	Hydraulic power packs	1.1, 1.2, 1.3, 1.4
	Radial piston pumps	1.2, 1.3
FORD	Valves	2.1, 2.2, 2.3, 2.4, 2.5
	Hydraulic power packs	1.1, 1.2, 1.3, 1.4
	Radial piston pumps	1.2, 1.3
PEUGEOT, CITROEN	Seated valves	2.2
	Hydraulic power packs	1.1

HAWE Hydraulik is listed with Dun & Bradstreet (D&B) under D-U-N-S® (Data Universal Numbering System) number 316724384.

## 6

Hydraulic system and circuit design is limited only by the creativity of the application engineer. All basic circuit design begins with the ultimate actuator functions in mind however.

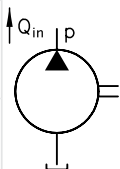

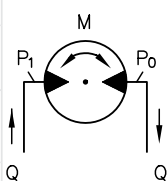

The most important condition for this is the definition or specification of relevant consumer variables, such as the loads (load forces, load torques or turning torques), motion functions (travel, speeds, rotational speeds, timing) etc.

The following formulas and tables are intended to serve as guideline only and should help with the planning of your hydraulic system.

Other factors that have an influence on the choice of hydraulic systems and components include noise emission values and thermal budget considerations.

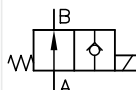

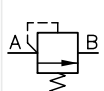

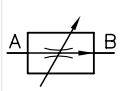

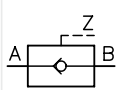

The following formulae and tables are non-binding and are intended to make producing the rough design for a hydraulic system easier.

Equipment	Formulas and description		
General information	Basic equations (static, without any loss)		
	$Q = \frac{V}{t}$ $V = A \cdot s$ $F = p \cdot A$ $p = \frac{F}{A}$ $Q = A \cdot v$ $M = \frac{V \cdot p}{2 \pi}$ $v = \frac{s}{t}$	force volume A: Area Q: Flow v: Speed V: Volume torque s: Travel (stroke) M: Torque	
Equipment	Formulas and description		Symbol
<b>Hydraulic cylinders</b> ■ Single acting	$A [mm^2] = \frac{\pi}{4} d^2 [mm]$ $v \left[ \frac{m}{s} \right] = \frac{s [mm]}{1000 t [s]}$ $F_s [N] = -0,1 p_B [bar] \cdot A [mm^2]$ $p_B [bar] = \frac{-10 F_s [N]}{A_1 [mm^2]}$ $Q_{in} [lpm] = 0,06 \cdot A [mm^2] \cdot v \left[ \frac{m}{s} \right]$	d: piston diameter [mm] A: piston area [mm²] F <sub>s</sub> : force [N] p <sub>B</sub> : operating pressure [bar] v: Piston speed $\left[ \frac{m}{s} \right]$ Q <sub>in</sub> : inflow [lpm] s: stroke [mm] t: time [S]	
■ Double acting	<b>Extending</b> Basic equations (balance of forces): $A_1 = \frac{\pi}{4} d_1^2 \approx 0,78 d_1^2$ $A_3 = \frac{\pi}{4} (d_1^2 - d_2^2)$ $p_1 \cdot A_1 = p_3 \cdot A_3 - F$ $p_1 = \frac{1}{A_1} (p_3 \cdot A_3 - F)$ $Q_{zu} = A_1 v$ $Q_{ab} = A_3 v$	Simplified: $p_1 [bar] = \frac{p_3 [bar] \cdot A_3 [mm^2] - 10 F [N]}{A_1 [mm^2]}$ $F [N] = \frac{-p_1 [bar] \cdot A_1 [mm^2] + p_3 [bar] \cdot A_3 [mm^2]}{10}$ p <sub>3</sub> is the result of back pressure from pipes and valves for Q <sub>out</sub> Attention: note possible pressure intensification!	
	<b>Retracting</b> Basic equations (balance of forces): $p_1 \cdot A_1 = p_3 \cdot A_3 + F$ $p_3 = \frac{1}{A_3} (p_1 \cdot A_1 - F)$ $Q_{zu} = A_3 v$ $Q_{ab} = A_1 v$  A <sub>1</sub> : piston area [mm²] A <sub>3</sub> : rod side area [mm²] d <sub>1</sub> : piston Ø [mm] d <sub>2</sub> : rod Ø [mm] F: force [N]	Simplified: $p_3 [bar] = \frac{p_1 [bar] \cdot A_1 [mm^2] - 10 F [N]}{A_3 [mm^2]}$ $F [N] = \frac{p_1 [bar] \cdot A_1 [mm^2] - p_3 [bar] \cdot A_3 [mm^2]}{10}$ p <sub>1</sub> result of back pressure from pipes and valves for Q <sub>out</sub>	
	A <sub>1</sub> : piston area [mm²] A <sub>3</sub> : rod side area [mm²] d <sub>1</sub> : piston Ø [mm] d <sub>2</sub> : rod Ø [mm] F: force [N]	Q <sub>in</sub> : inflow [lpm] Q <sub>out</sub> : outflow [lpm] p <sub>1</sub> : pressure, piston side [bar] p <sub>3</sub> : pressure, rod side [bar] s: stroke, travel [mm]	

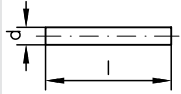

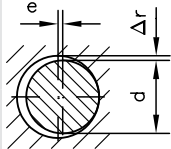

Equipment	Formulas and description		Symbol
<b>Hydraulic pumps / hydraulic motors</b>	Basic equations:	$\Delta p = p_1 - p_o^{1)}$	Simplified:
	Geometric volume per revolution (piston pumps):	$V = A \cdot h$	$V[cm^3] \approx \frac{A[mm^2] \cdot h[mm]}{1000}$
	Flow:	$Q = V \cdot n$	$Q[lpm] \approx \frac{V[cm^3] \cdot n[min^{-1}]}{1000}$
	Middle torque:	$M = \frac{V \cdot \Delta p}{2 \pi}$	$M[Nm] \approx \frac{V[cm^3] \cdot \Delta p[bar]}{62}$
	Power:	$P_{hydr} = \Delta p \cdot Q$	$P_{hyd}[kW] \approx \frac{\Delta p[bar] \cdot Q[lpm]}{612}$
	Power consumption (pump):	$P_{mech} = \frac{\Delta p \cdot Q}{\eta_T} = \frac{M \cdot 2 \pi n}{\eta_T}^{2)}$	$P_{drive}[kW] \approx \frac{\Delta p[bar] \cdot Q[lpm]}{500}$
	Power rating (motor):	$P_{max} = \Delta p \cdot Q \cdot \eta_T = M \cdot 2 \pi n \cdot \eta_T^{2)}$	$P_{out}[kW] \approx \frac{\Delta p[bar] \cdot Q[lpm]}{740}$ $\approx \frac{M[Nm] \cdot n[min^{-1}]}{12000}$
V: displacement [cm <sup>3</sup> ] A: effective piston area [mm <sup>2</sup> ] h: double stroke [mm] n: rev. rating [rpm] M: middle torque [Nm] p: pressure [bar] Δp: effective pressure [bar] Q: flow [lpm] P <sub>hydr</sub> : hydraulic performance [kW] P <sub>mech</sub> : mechanical performance [kW] η <sub>T</sub> : total efficiency (including volumetric and mechanical losses)		Guideline: A power rating of 1 kW for the drive is necessary to achieve a delivery flow of Q = 1 lpm with operating pressure p = 500 bar!	 Hydraulic pump  Hydraulic motor

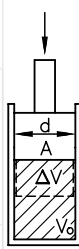

<sup>1)</sup> p<sub>o</sub> result of back pressure from pipes and valves

<sup>2)</sup> incl. degree of efficiency η<sub>T</sub> ≈ 0.82

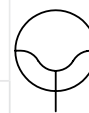

Equipment	Formulas and description	Symbol
<b>Valves</b> Directional valves Pressure valves Metering valves Check valves	Losses of pressure by streaming fluid The pressure loss in hydraulic systems consists of: <ul style="list-style-type: none"> <li>■ Back pressure of valves</li> <li>■ Back pressure of pipes</li> <li>■ Back pressure due to geometric shape (elbows etc.)</li> </ul> Pressure losses Δp in the valves that are caused by the flow of fluid can be found in the Δp-Q characteristics of the relevant documentation. For the purposes of an initial rough design, a performance loss of approx. 20... 30% in the overall control system can generally be expected.	Examples: Directional valve  Pressure limiting valve  Flow control valve  Releasable check valve 

Equipment	Formulas and description	Symbol
<b>Orifices</b> (ideally, sharp edged) e.g. orifice inserts type EB; by-pass check valves type BC, BE	Basic equation: $Q \approx \alpha \cdot \frac{\pi}{4} d^2 \sqrt{\frac{2 \Delta p}{\rho}}$ Q: flow [lpm] Δp: back pressure between A and B [bar] d: orifice diameter [mm]	Simplified: $Q \approx 0.55 d^2[mm] \cdot \sqrt{\Delta p[bar]}$ $d \approx 1.35 \cdot \sqrt{\frac{Q[lpm]}{\Delta p[bar]}}$

Equipment	Formulas and description		Symbol

Equipment	Formulas and description		Symbol
Pipes / hoses	<p>The diameter of pipes and/or hoses should be selected in such a way that back pressure is minimized.</p> <p>Basic equations: <math>Re = \frac{v \cdot d}{\nu}</math>   <math>\lambda_R = \frac{64}{Re}</math>   <math>\Delta p = \lambda_R \cdot \frac{l}{d} \cdot \frac{\rho}{2} v^2</math></p> <p><math>\lambda_R</math>: pipe back pressure coefficient  <math>\Delta p</math>: back pressure [bar]  <math>l</math>: pipe length [m]  <math>d</math>: pipe diameter [mm]  <math>\nu</math>: cinematic viscosity [mm<sup>2</sup>/s]  <math>Q</math>: flow [lpm]  <math>Re</math>: Reynolds No. (&lt; 2300)  <math>\rho</math>: density (approx. 0.9 g/cm<sup>3</sup>)  <math>v</math>: flow velocity [<math>\frac{m}{s}</math>]</p>	<p>Simplified:</p> $Q[l/min] \leq 0,108 \cdot d[mm] \cdot v \left[ \frac{mm^2}{s} \right]$ $d[mm] \geq \frac{9.2 \cdot Q[lpm]}{v \left[ \frac{mm^2}{s} \right]}$ $\frac{\Delta p}{l} \left[ \frac{bar}{m} \right] \approx \frac{6,1 \cdot v \left[ \frac{mm^2}{s} \right] \cdot Q \left[ \frac{l}{min} \right]}{d^4[mm]}$	
Equipment	Formulas and description		Symbol
Back pressure due to geometric shape (elbows etc.)	<p>Basic equations: <math>\Delta p = \xi \cdot \frac{\rho}{2} v^2</math>   <math>v = \frac{Q}{A} = \frac{4Q}{\pi d^2}</math></p> <p>90° elbow   <math>\xi = 0,15</math></p> <p>straight pipe fitting   <math>\xi = 0,5</math></p> <p>elbow fitting   <math>\xi = 1,0</math></p> <p>Simplified:</p> $\Delta p[bar] = 2,2 \cdot \xi \cdot \frac{Q^2[lpm]}{d^4[mm]}$ <p><math>\Delta p</math>: back pressure [bar]  <math>\xi</math>: back pressure coefficient  <math>\nu</math>: cinematic viscosity [mm<sup>2</sup>/s]  <math>d</math>: pipe diameter [mm]  <math>\rho</math>: density (approx. 0.9 g/cm<sup>3</sup>)</p>		
Equipment	Formulas and description		Symbol
Leakage losses (by concentric (e = 0) and eccentric gaps)	<p>Basic equation:</p> $Q_L = \frac{\pi \cdot d \cdot \Delta p^3}{12 \cdot \nu \cdot \rho} \cdot \frac{\Delta p}{l} (1 + 1,5 \cdot \epsilon^2)$ <p><math>e</math>: eccentricity [mm]  <math>\Delta r</math>: gap [mm]  <math>\Delta p</math>: Pressure difference [bar]  <math>d</math>: diameter [mm]  <math>\nu</math>: cinematic viscosity [mm<sup>2</sup>/s]  <math>l</math>: gap length [mm]  <math>\rho</math>: density (approx. 0.9 g/cm<sup>3</sup>)</p>	<p>Simplified:</p> $Q_L = 1848 \cdot \frac{d \cdot \Delta r^3}{\nu} \cdot \frac{\Delta p}{l} (1 + 1,5 \cdot \epsilon^2) \quad \epsilon = \frac{e}{\Delta r}$	

Equipment	Formulas and description		Symbol
<b>Volumetric losses</b> (due to pressure increase)	Basic equation: $\Delta V = \beta_p \cdot V_o \cdot \Delta p$ with $\Delta p = p_2 - p_1$		$F = \Delta p \cdot A$ 
	p <sub>1</sub> : pressure, start [bar] p <sub>2</sub> : pressure, end [bar] V <sub>o</sub> : initial volume [l] Δ: $\vartheta$ volume alternation [l] β <sub>p</sub> : compressibility	Simplified: $\Delta V = 0,7 \cdot 10^{-4} \cdot V_o \cdot \Delta p$ (with $\beta_p \approx 0,7 \cdot 10^{-4} \frac{1}{\text{bar}}$ )	
<b>Volumetric losses</b> (due to temperature rise)	Basic equation: $\Delta V = \beta_T \cdot V_o \cdot \Delta \vartheta$ mit $\Delta \vartheta = \vartheta_2 - \vartheta_1$		
	$\vartheta_1$ : temperature, start [°C] $\vartheta_2$ : temperature, end [°C] Δ $\vartheta$ : temperature, difference [K] V <sub>o</sub> : initial volume [l] ΔV: volume alternation [l] β <sub>T</sub> : expansion coefficient	Simplified: $\Delta V = 0,7 \cdot 10^{-3} \cdot V_o \cdot \Delta \vartheta$ (mit $\beta_T \approx 0,7 \cdot 10^{-3} \frac{1}{K}$ )	
<b>Pressure increase caused by temperature rise</b> (without volumetric compensation)		$\Delta V = 0,7 \cdot 10^{-4} \cdot \Delta p = 0,7 \cdot 10^{-3} \cdot \Delta \vartheta$ i.e. $\Delta \vartheta \approx 1K \Leftrightarrow \Delta p \approx 10\text{bar}$	
	<b>Note:</b> A temperature rise of trapped oil volume will cause a pressure increase! (i.e. a pressure limiting valve will be required sometimes) <b>Guideline:</b> The pressure will rise by approx. 10 bar for 1 K of temperature increase.		

Equipment	Formulas and description	Symbol
<b>Hydraulic accumulators</b> Pressure alternations, isotherm (slow) adiabatic (quick)	Hydraulic accumulators are intended for the supply of pressurized fluid during sudden demands (quick, adiabatic pressure alternations), compensation of leakage losses or to dampen oscillations (slow, isotherm pressure alternations).	
	Basic equations:	$p_1 = 1,1 \cdot p_o$
	isotherm (slow)	$\Delta V = V_1 \left( 1 - \frac{p_1}{p_2} \right)$
	adiabatic (quick)	$\Delta V = V_1 \left( 1 - \left( \frac{p_1}{p_2} \right)^{0,71} \right)$
	p <sub>o</sub> : filling pressure for the gas [bar] p <sub>1</sub> : lower operating pressure [bar] p <sub>2</sub> : upper operating pressure [bar] V <sub>1</sub> : initial volume [l] ΔV: volume alternation [l]	

Equipment	Formulas and description
<b>Cavitation</b>	Approx. 9 % (volumetric) air are solved in oil at atmospheric pressure. There is the danger of bubble cavitation during atmospheric pressure below 0,2 bar. These situations can occur, accompanied by sudden noise, during suction process of pumps and cylinders as well as at extreme throttle sections. The hydraulic components where this occurs will show increased wear.

Equipment	Formulas and description	
<b>Thermal level</b> Dissipation power and oil temperature	The hydraulic power losses in a hydraulic system result in a temperature rise of the fluid and the equipment which is partly radiated to the surroundings via the surface of the system. They roughly amount 20 - 30% of the induced performance. The induced and the radiated heat will balance at some point after the warm-up of the system.	
	Basic equations: $P_V = 0,3 \cdot P_{hydr}$ $\vartheta_{Ölmax} \approx \vartheta_{Umg} + C \cdot \frac{P_V}{A}$	
	Surface with unhindered circulation $c \approx 75$ Surface with bad circulation $c \approx 120$ with fan ( $v \approx 2$ m/s) $c \approx 40$ Oil/water radiator $c \approx 5$	Simplified: $\vartheta_{Ölmax} \approx \vartheta_{Umg} + C \cdot \frac{0,3 \cdot P_{hydr}[kW]}{A[m^2]}$
	$P_V$ : performance loss, transformed in heat [kW] $P_{hydr}$ : hydraulic performance [kW] $\vartheta_{ölmax}$ : max. fluid temperature [°C] $\vartheta_{amb}$ : ambient temperature [°C] A: surface of the system (tank, pipes etc.) [m²]
